

Status of the surface reanalysis, uncertainties and observations.

E. Bazile, R. Abida, C. Soci, F. Besson

GA3 UERRA

Toulouse, 1-3 February 2016

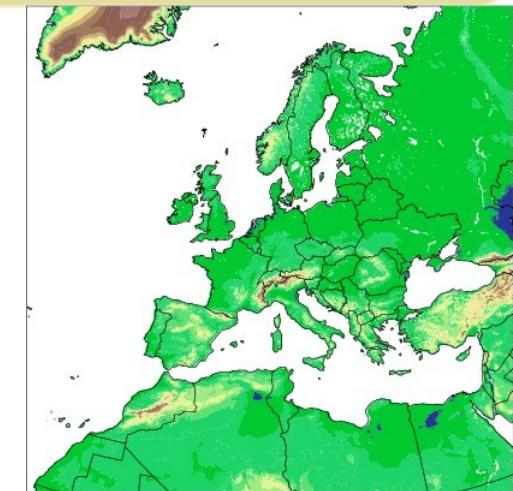

Outline

- What's new since Tortosa's GA
- Evaluation of the background precipitation fields
 - Static or dynamical downscaling, some results & some questions ...
- Estimation of uncertainties for the testbed period (2006-2010)
- Surface observations
- Deliverables Surface re-analysis in UERRA
 - test-bed for uncertainties estimation (2006-2010)
 - 50 years (1961-2010) surface re-analysis
- Conclusions

What's new since Tortosa's GA

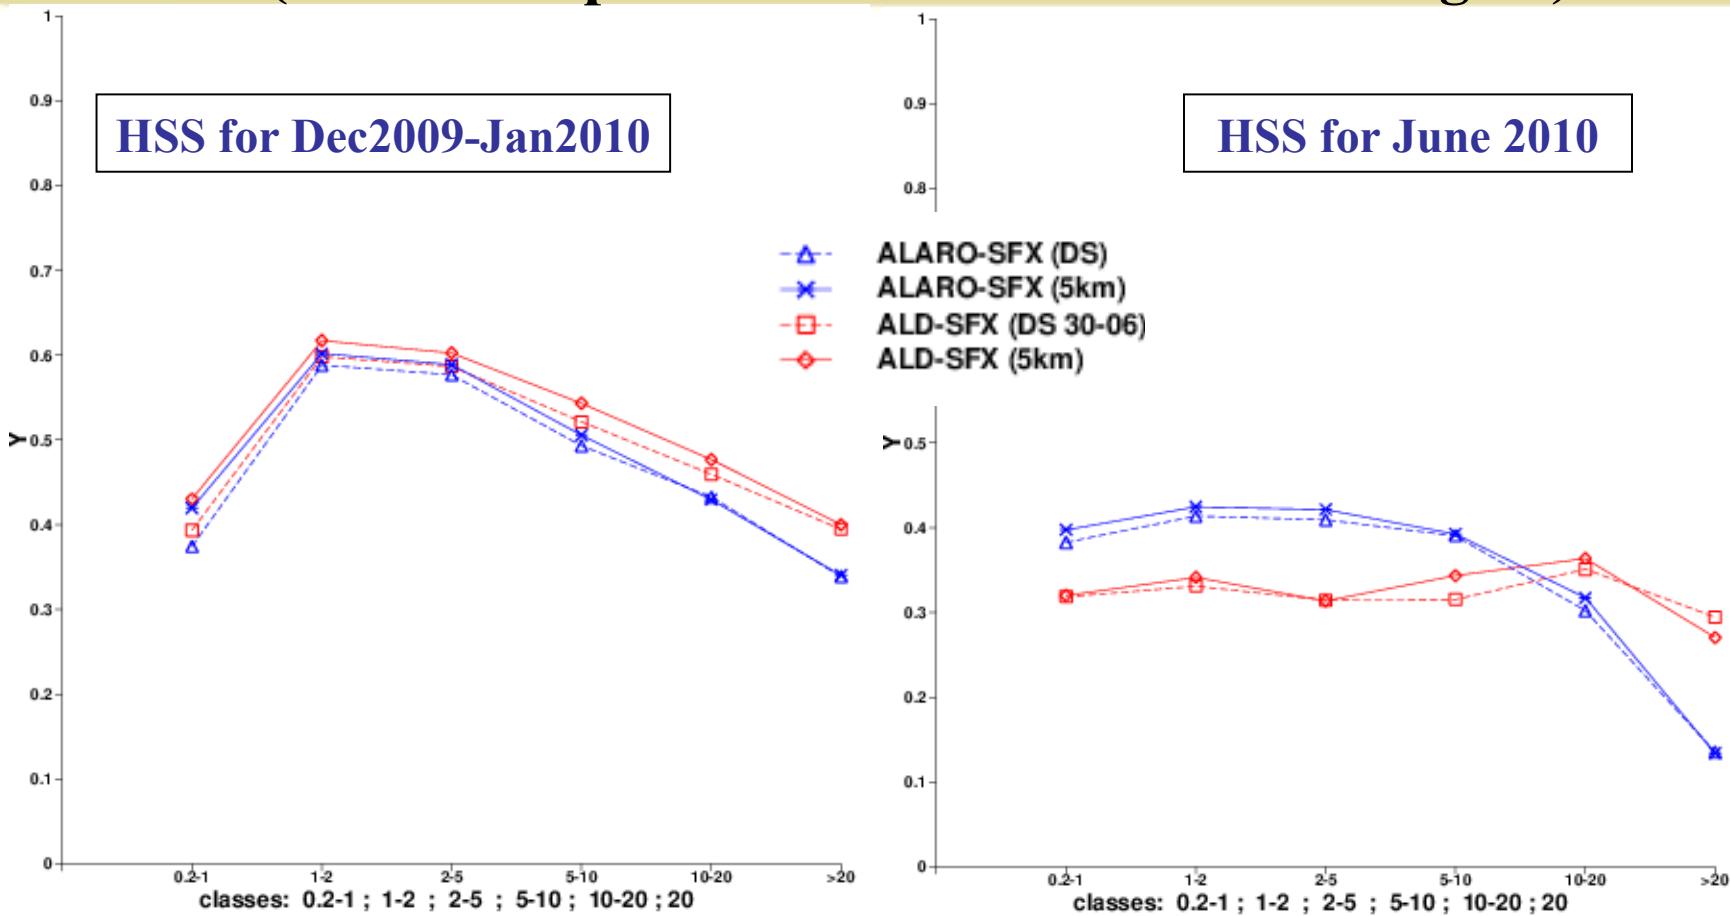

- Cornel Soci left to ECMWF 1/11/2015 after 5 years at MF (EURO4M/UERRA)
 - Soci C., E. Bazile, F. Besson & T. Landelius "High-resolution precipitation re-analysis system for climatological purposes" Tellus minor revision (new version sent last week)
- Rachid Abida since 1/10/2015 (UERRA) works on the surface re-analysis
- Camille Scypta 15/02/2016 (UERRA) will work on SURFEX/TRIP driven by MESCAN
- ECMWF resources : request for special project (2016-2017) ?

Estimation of uncertainties for the testbed period (2006-2010)

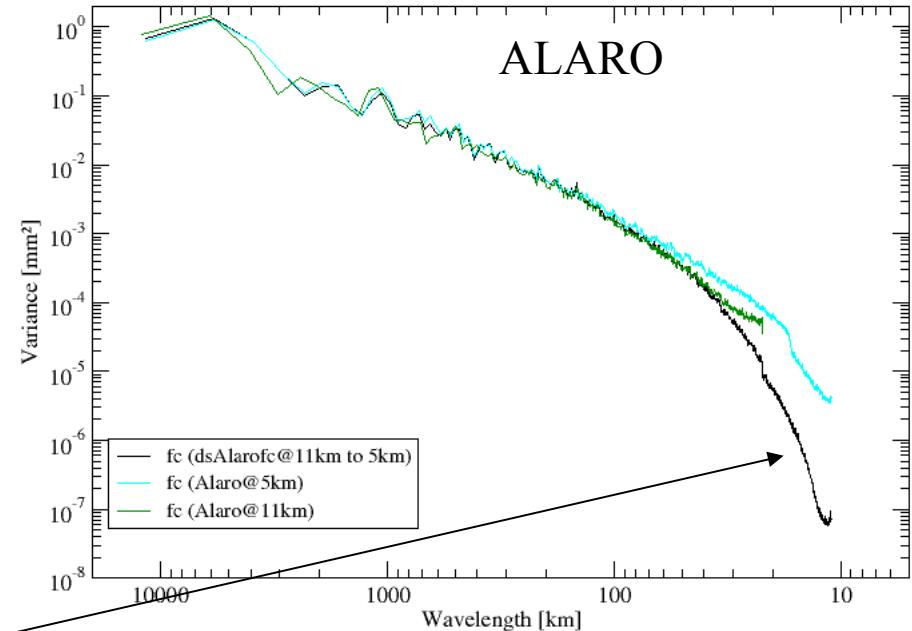

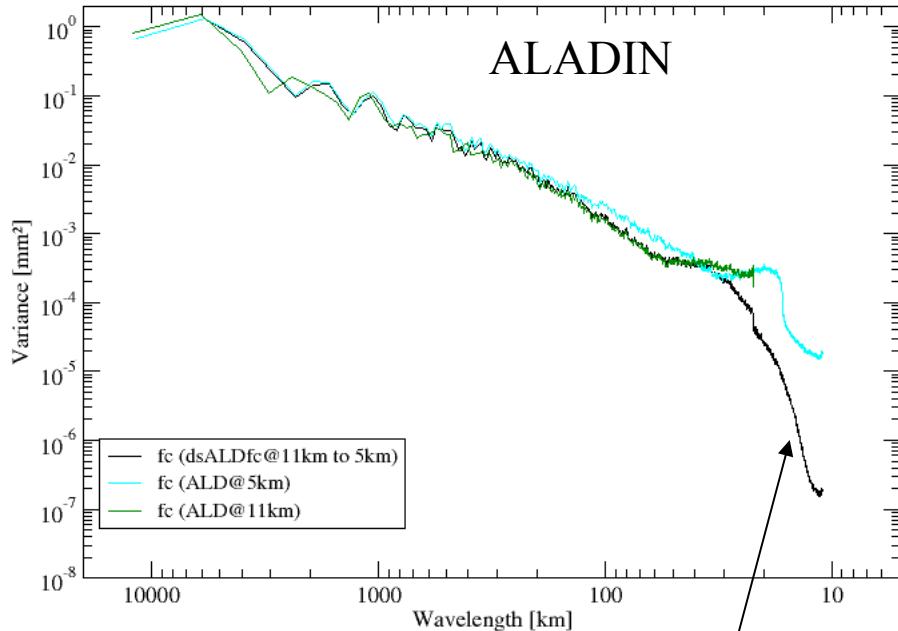

- Two horizontal resolutions :
 - 1: 576x576 @11km grid, 65Levels (same as SMHI)
 - 2: 1080x1080 @5.5km grid, 65Levels (nested)
- Several experiments with different physics @5.5km (Dec2009, Jan2010, June 2010) to evaluate the impact of an ensemble background
 - ALADIN physics with 2 surface schemes: ISBA and SURFEX
 - ALARO physics with 2 surface schemes: ISBA and SURFEX
 - Background for T2M, Hu2m and Wind are improved with the model at 5.5km vs the downscaling of the 11km background (C. Soci et al, EMS2014), also for the precipitation ?

Heidke Skill Score (HSS) of 24-h Precipitation Background (scores computed over France on a 0.1x0.1 grid)

ALADIN slightly better skill in winter, whereas ALARO better in June for light and moderate precip,
Model integration at 5.5km improves slightly the HSS for both physics (full line vs dashed line) but ...

Variance Spectra of Monthly Mean 24-h Precipitation Forecast (Dec2009)

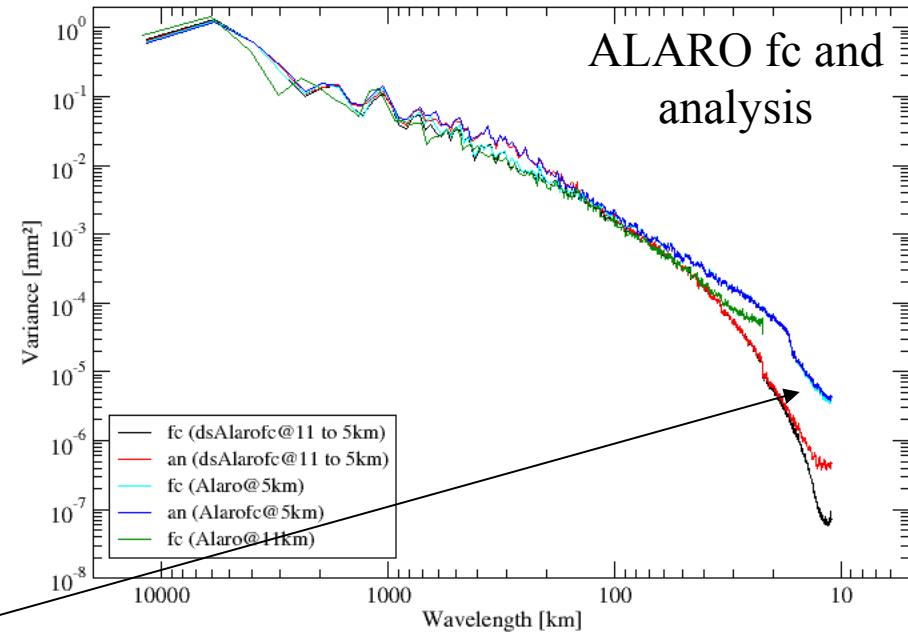

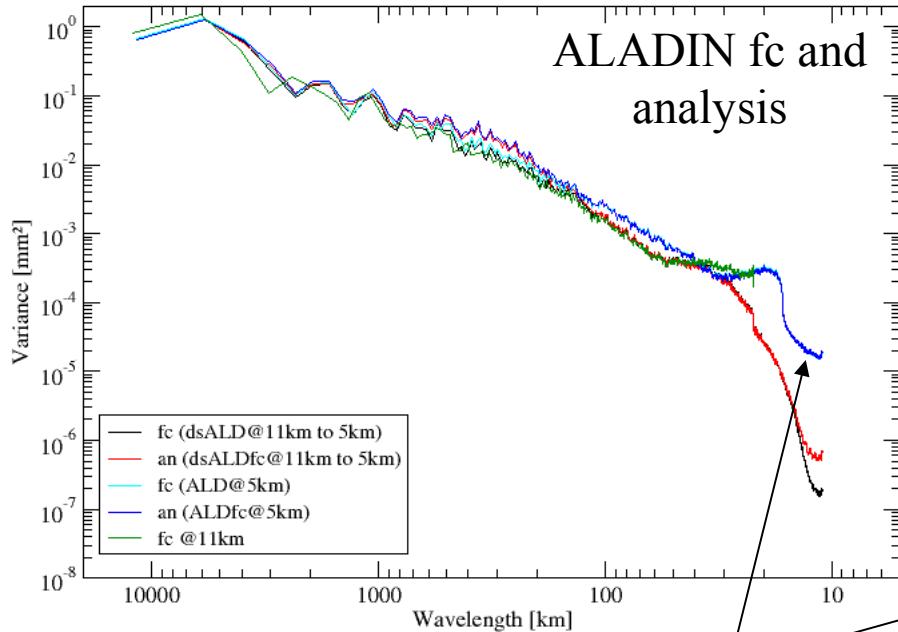

- Spurious tail introduced by downscaling (interpolation) from 11km to 5.5km grid

BACKGROUND fields:

- **Black:** downscaled fc from 11km to 5km
- **CYAN:** forecast at 5.5 km grid
- **GREEN:** forecast at 11 km grid

Variance Spectra of Monthly Mean 24-h precipitation

Background and Analysis (Dec2009)

-The precipitation analysis does not modify the variance at small scales when the background is a forecast field at 5.5km.

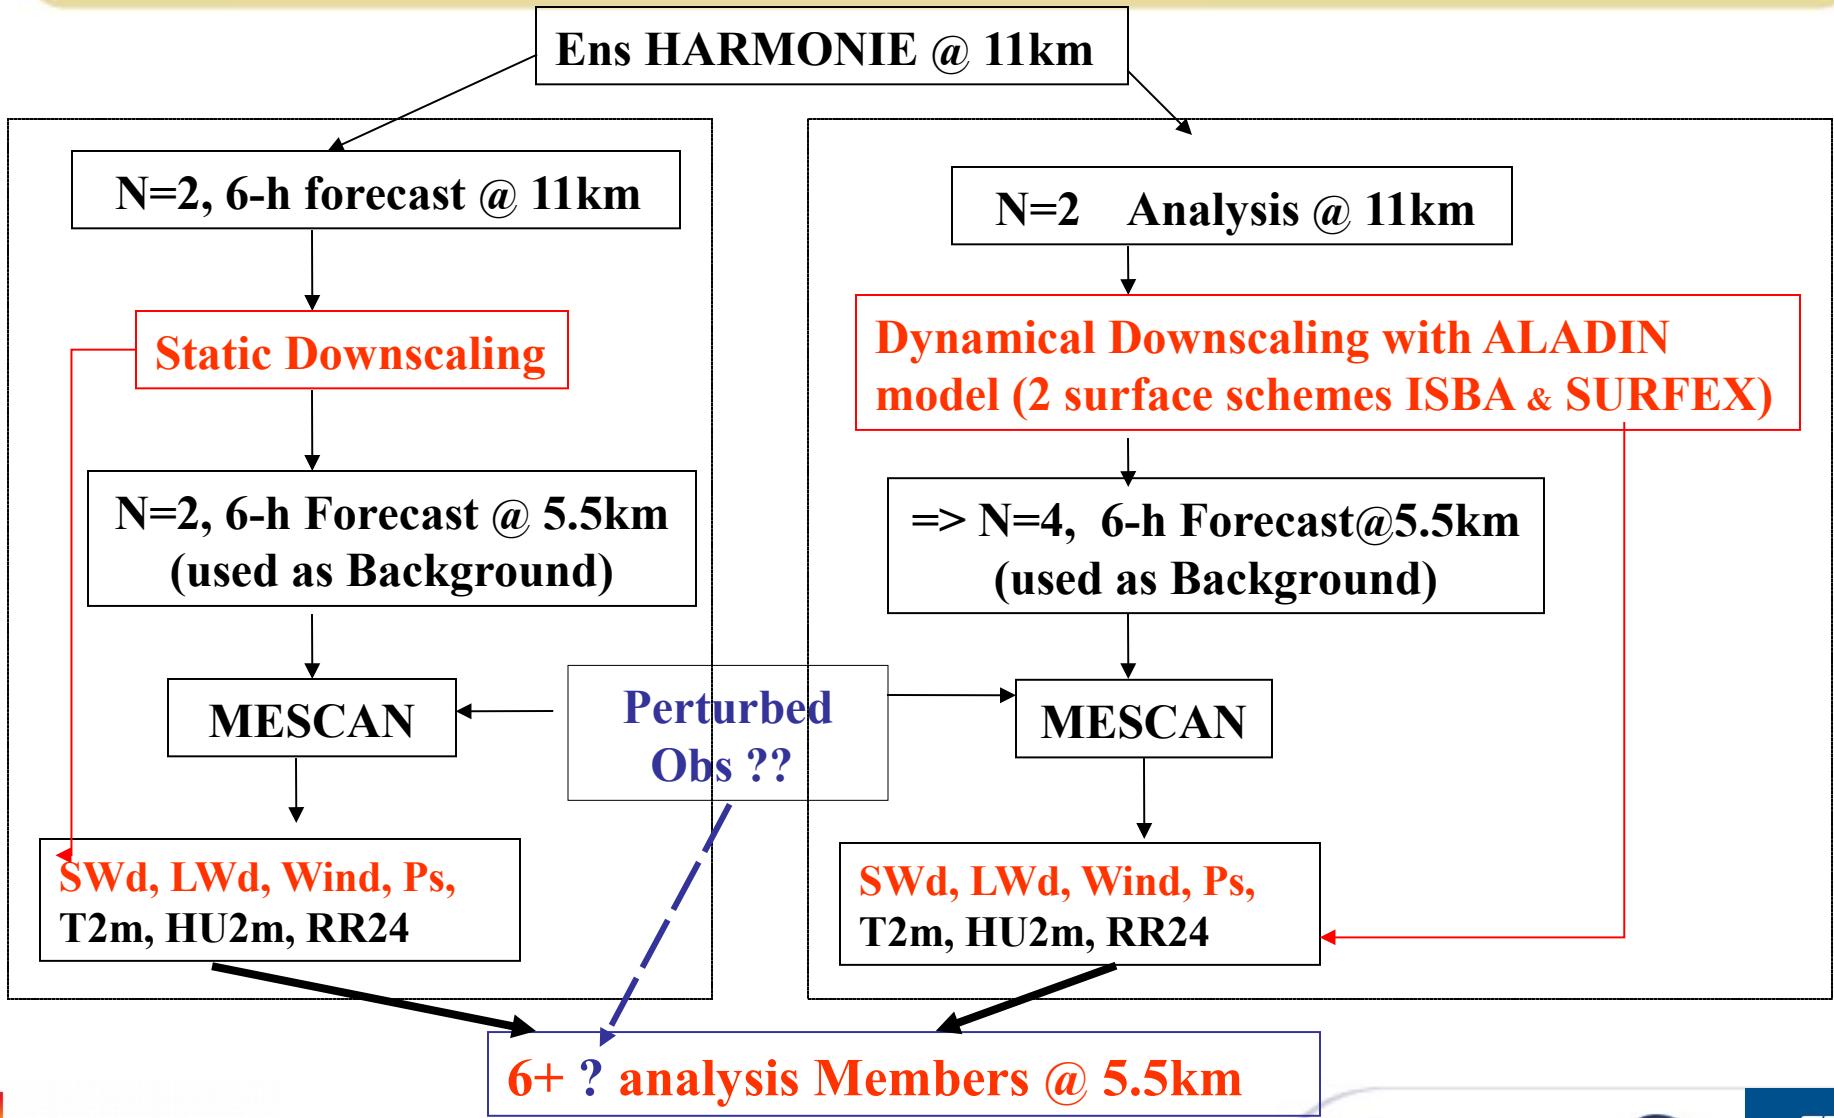

BACKGROUND fields:

- **Black:** downscaled fc from 11km to 5km
- **CYAN:** forecast at 5.5 km grid
- **GREEN:** forecast at 11 km grid

ANALYSIS:

- **Red:** analysis with downscaled fields
- **Blue:** analysis with forecast at 5.5km

Ensemble of Surface analyses 2006-2010 (Test-bed)

Ensemble system at 5.5km

2 types of ensemble :

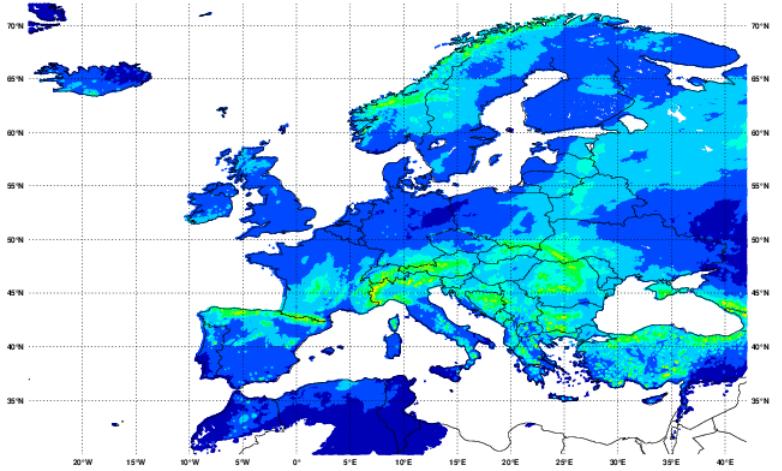

1. Ens-6 (poor ensemble !): 6 members based on 6 backgrounds at 11Km and downscaled to 5.5km: 2 physics with SURFEX, and forecast length combination for RR24 (or background) 24h, 2*12h, 4*6h (Ens-6 only used for precipitation analysis)

2. Ens-8 (rich ensemble) :

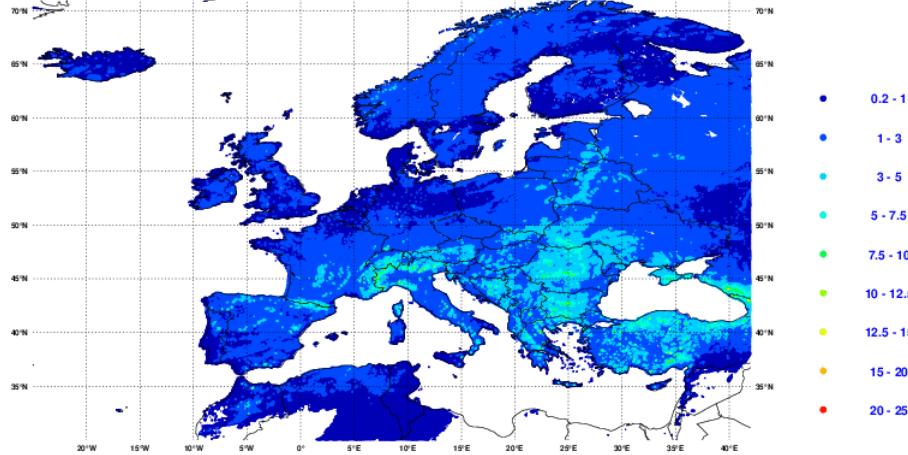

- # 4 members from 4 physics package (ALADIN with/no SURFEX and ALARO with/no SURFEX) at 11Km → downscaled to 5.5km (static)
- # 4 members from 4 physics package (ALADIN with/no SURFEX and ALARO with/no SURFEX) at 5.5Km

Ensemble (8-members) MEAN and SD of 24-h Precip Background and Analysis (June 2010)

Merge 2 12h-accumulated RR files and the 24h RR one.
Need some help and interaction with WP1
(KNMI, URV) to create BUFR file for RR24.

Surface observations T2m, Hu2m & RR24

- MF Type 0 Surface observations for 55 years since 1960 are now available on ECFS (Rachid's email 11th Dec 2015)
- Data are available on 3-hourly basis for T2m, Td2m, RH2m, SP and FF. Precipitation is available on daily basis and accumulated over 24 hours, with the following convention:
 - Precipitation text file (e.g., BDCLIM_TYPE0_Q_20141231) for day J accumulated precipitations for the period [J 06 UTC; J+1 06 UTC]
 - BUFR file for J 06 UTC (e.g. ob2014123106.bufr), accumulated precipitation over the past 24 hours.

On ECFS:

ec:/rml/uerra/bdclim/type0/text: for text format
(BDCLIM_TYPE0_H_20141231 & BDCLIM_TYPE0_Q_20141231).

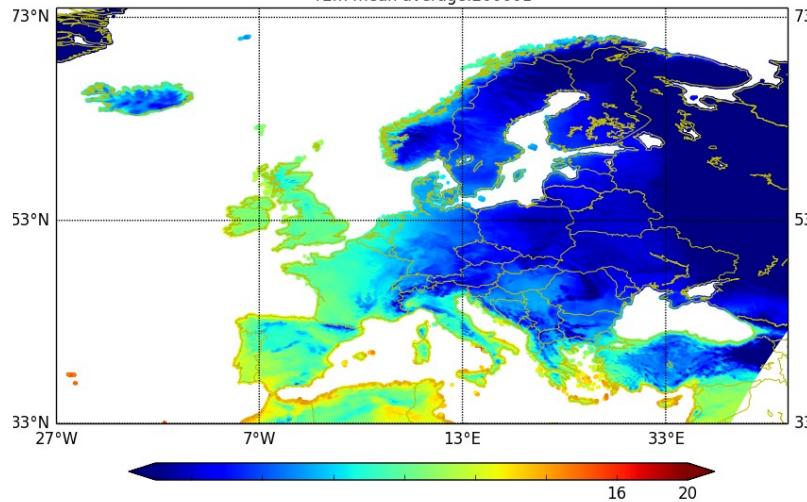

ec:/rml/uerra/bdclim/type0/bufr: for bufr format (e.g., ob2014123106.bufr).

Deliverables Surface re-analysis in UERRA

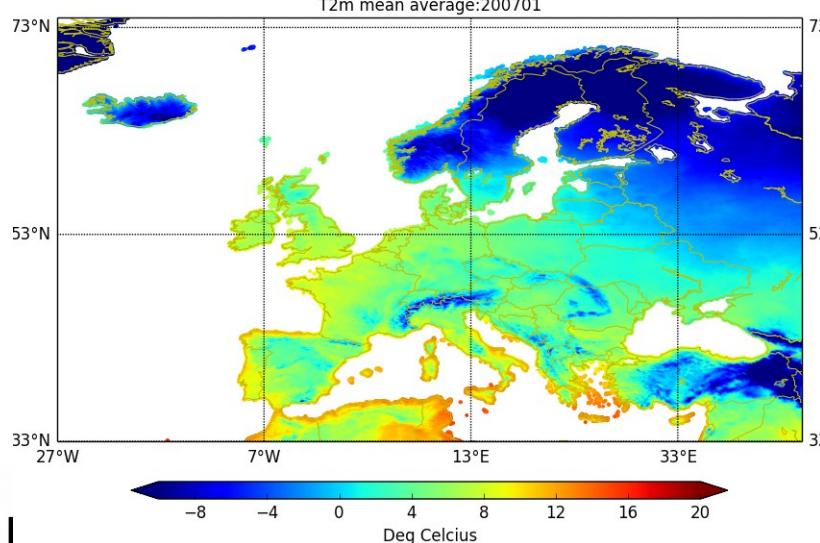

- M30 : report of ensemble re-analysis → probably delayed to M33-36
- M36 : 5 years ensemble with uncertainties
- 24h for 1 month of analysis T2M and Rh2m → 5 years in 2 months (1 member)
- **Volume space for 1 member:**
 - Analysis file: 0.7 Gb /run
 - => 5years *365days * 4 runs/day * 0.7 Gb= 5.11 Tb (T2m and Rh2m)
 - => 5years *365days * 1 run/day * 0.7 Gb = 1.28 Tb (RR24)
 - **Total space: 6.4 Tb (for 5 years) for native binary FA files**
- **2006 re-analysis is done for the reference analysis T2m, Hu2m, 2007 started.**
- **RR analysis will start soon for 2006 and the ensemble with the perturbed obs for T2m and Rh2m.**

ERA-I 2007 January

Conclusions & perspectives

- # Fine scale comes from the background (especially for RR). The analysis, due to the observation network, does not modify the "horizontal scale".
- # For the T2m, Hu2m uncertainties (period 2006-2010) : the perturbed observation method with a background from HARMONIE-ALADIN at 11Km (from SMHI) downscaled at 5.5km will be used.
- # For the RR24 uncertainties :
 - # The cheap Ens-6 for RR is clearly under dispersive
 - # The Ens-8 is less under dispersive but very expensive with 4 members from a full model at 5.5km. So the perturbed observation method will be evaluated for the RR ensemble analysis . Maybe, perturbed background will be associated with perturbed observation ?
- # WP1 (URV,KNMI) and MF : common effort to create observations file (BUFR) for RR24 especially before the 80's.

Thank you for your attention! Questions ?
