

# 5 years Ensemble surface re-analysis with MESCAN

---

E. Bazile & R. Abida

UERRA GA4 21–23 November 2016,  
ECMWF, Reading, UK

# Outline

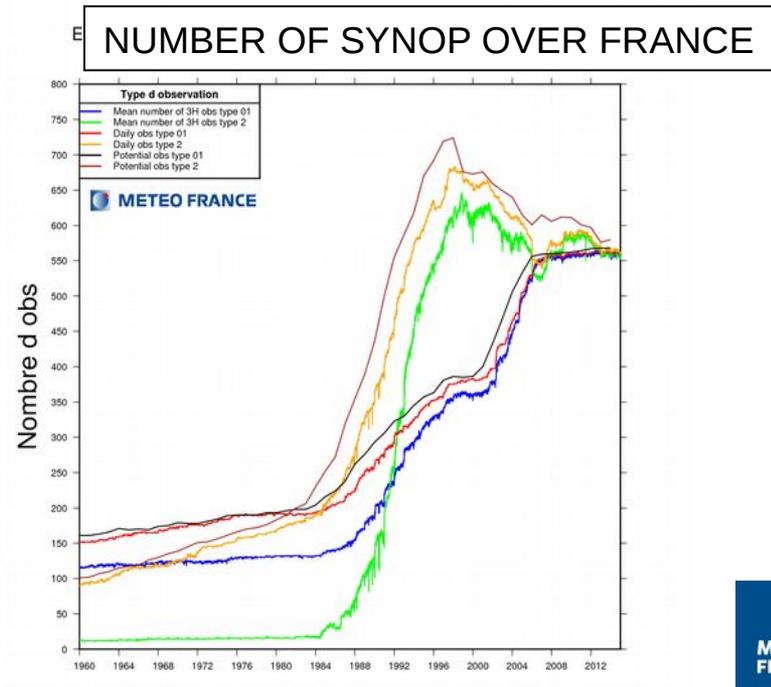

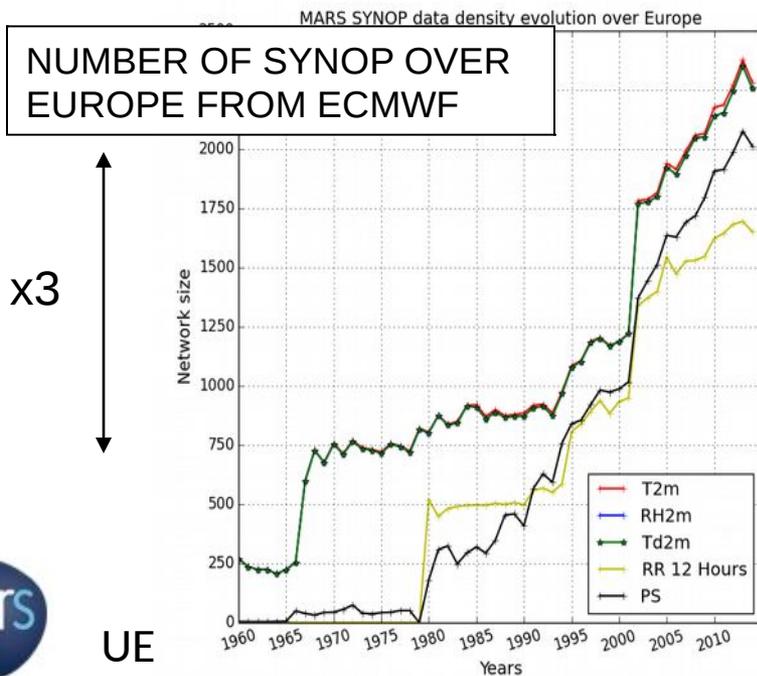

---

- How to estimate uncertainties:
  - Observation network & perturbation
  - Model physics
- Ensemble system for 2006-2010
  - For precipitation
  - For 2m temperature & relative humidity
- Production status
- Conclusions

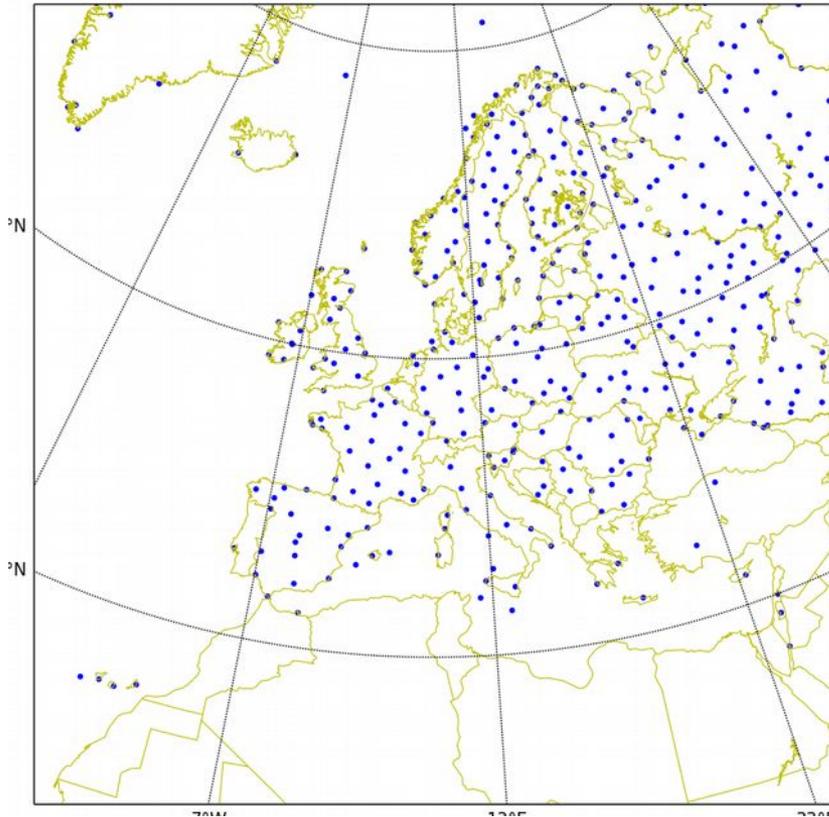

# Surface observations T2m, Hu2m & RR24

- # **Surface observation density is a critical factor**, without enough observations the reanalysis tends to drift towards the model climatology.
- # A sharp increase in observation density might lead to misleading results. Particularly, for surface trend interpretation..
- # T2m & RH2m are from GTS, while those for RR24 are from some national data base (MF and SMHI) & ECA&D.

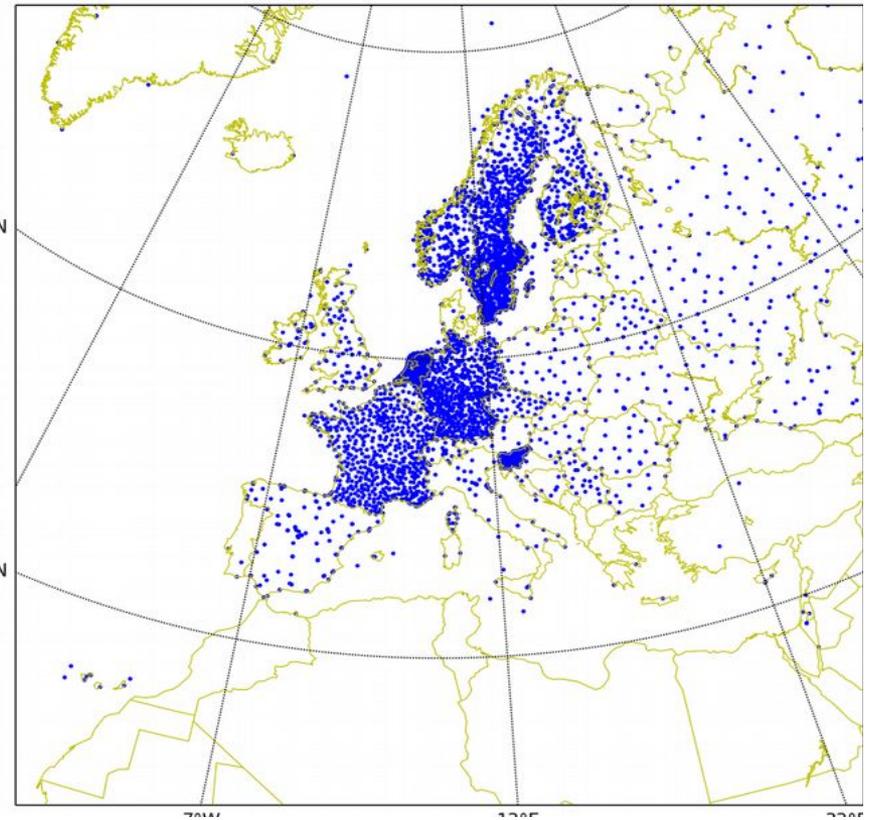

# High & low surface observation density patterns for the test-bed period (2006-2010):RR24

Low density ( ~ 470 obs)

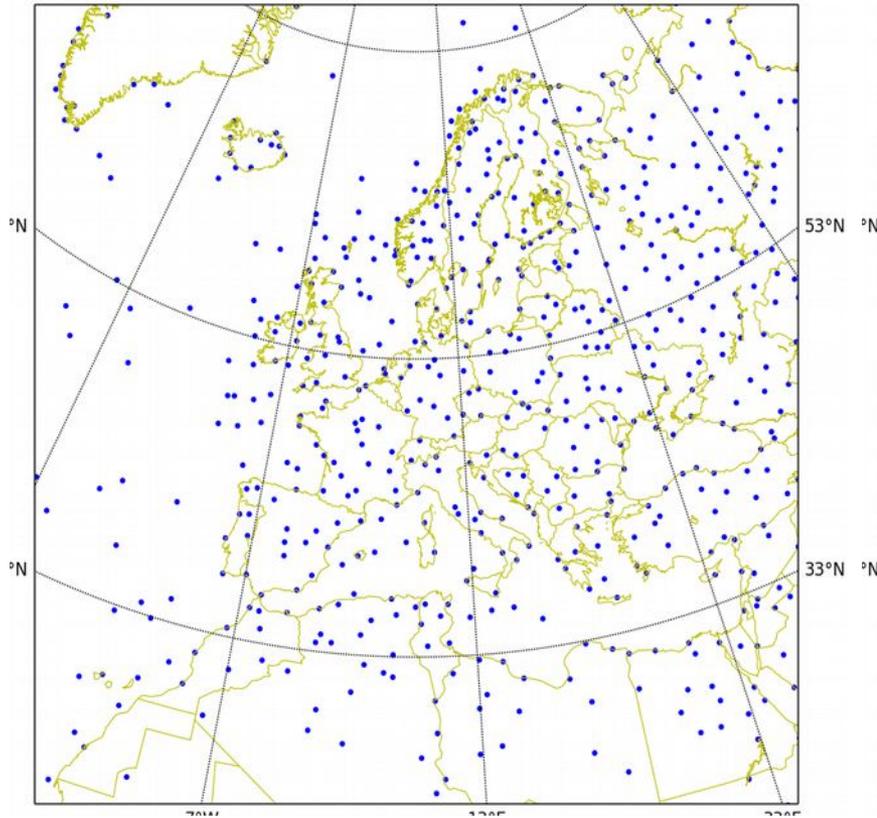

High density ( ~ 4540 obs)

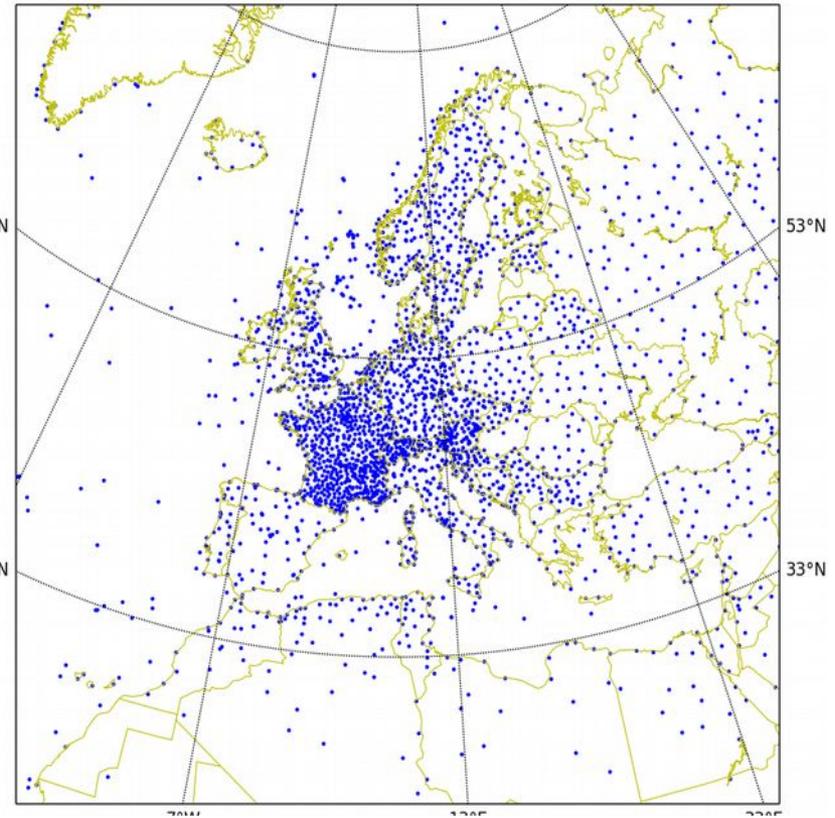

# High & low surface observation density patterns for test-bed period (2006-2010): T2m & RH2m

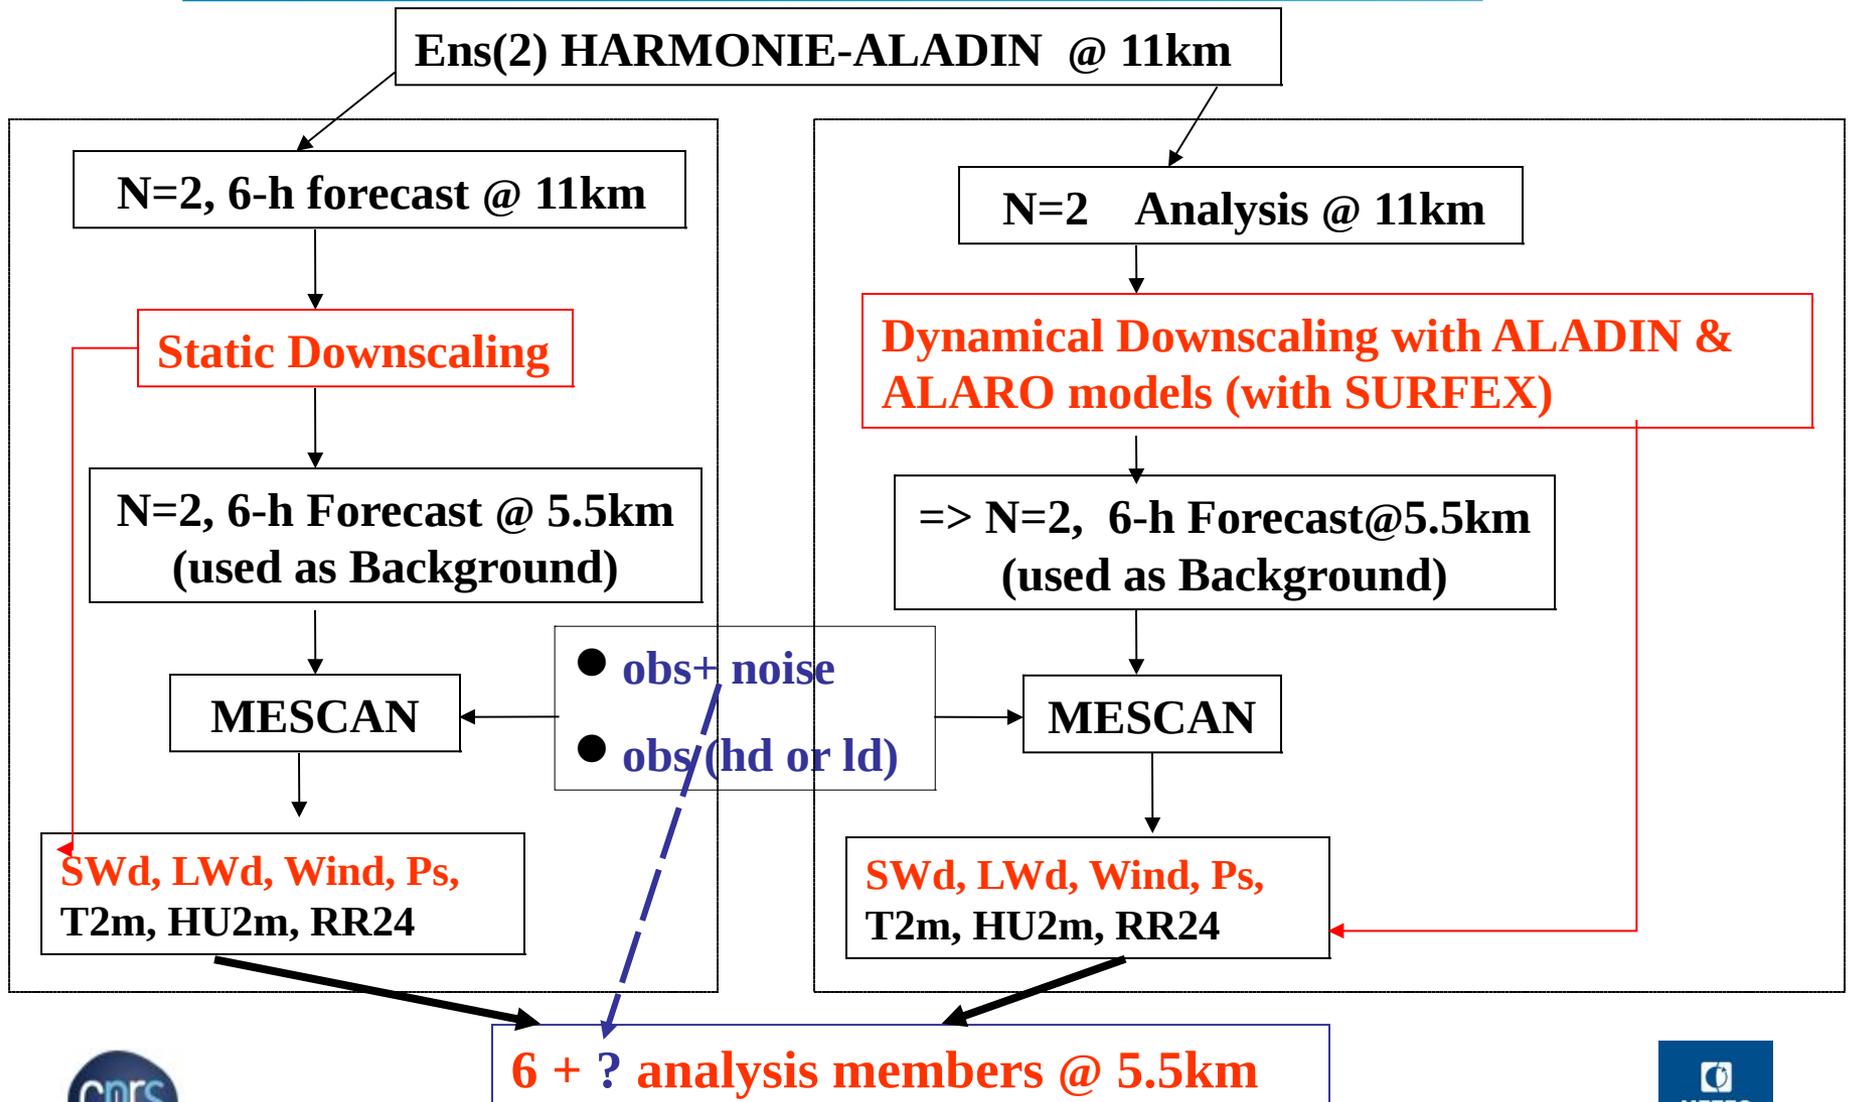

Low density ( ~830 obs )

High density ( ~ 3080 obs )

# Ensemble of Surface analyses 2006-2010 (Test-bed)

# Setup for the Ensemble System at 5.5km for the 24h precipitation analysis

---

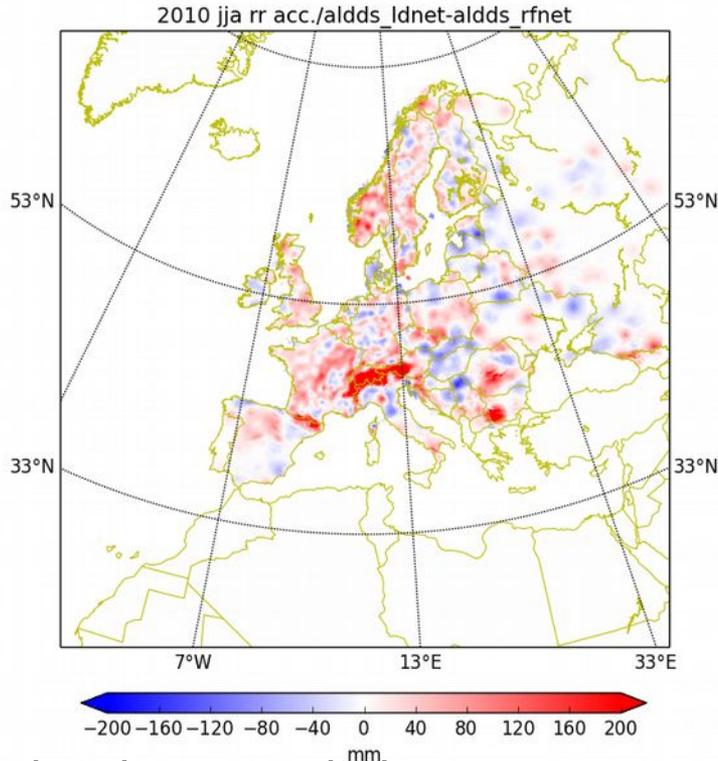

## 6 members :

- # Two members from ALADIN & ALARO physics (with SURFEX) at 11km downscaled at 5.5km
- # Two types of the observation network : low density and ‘all obs’ .
- # One ALADIN (with SURFEX) forecast at 5.5km :
  - # better background for the surface analysis (vs the static downscaling)
  - # necessary to have “fine scale structure” for the precipitation Soci et al. (2016)
  - # BUT it is more expensive and is it necessary to :
    - # improve the ensemble spread for the precipitation ?
    - # improve the surface fluxes, the snow cover, the river discharge computed by SURFEX-TRIP driven by MESCOAN ?

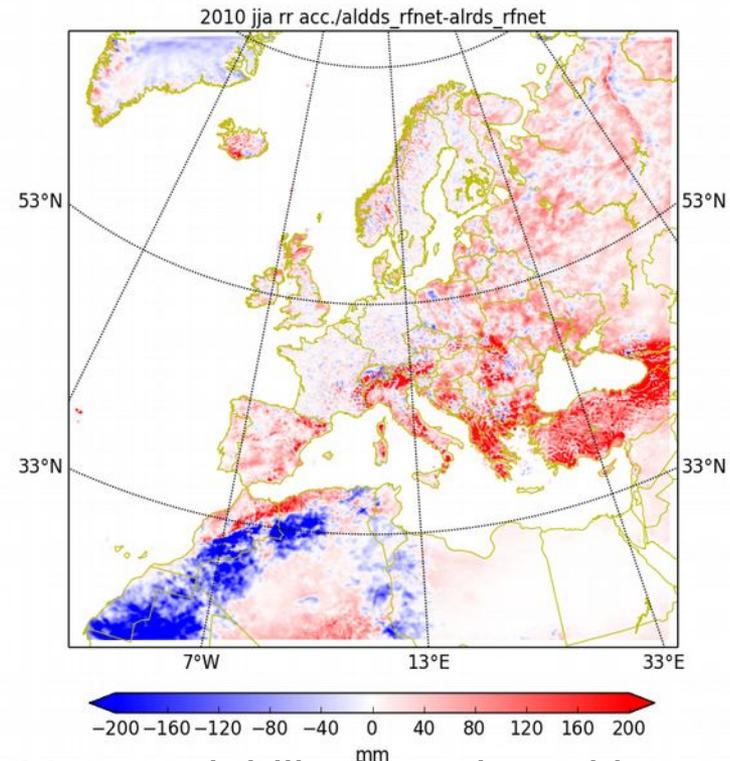

# Effect of observation density and the physics on the RR surface reanalysis (JJA2010)

## Impact of network density

Low density network does not constrain enough model precipitations particularly over mountain

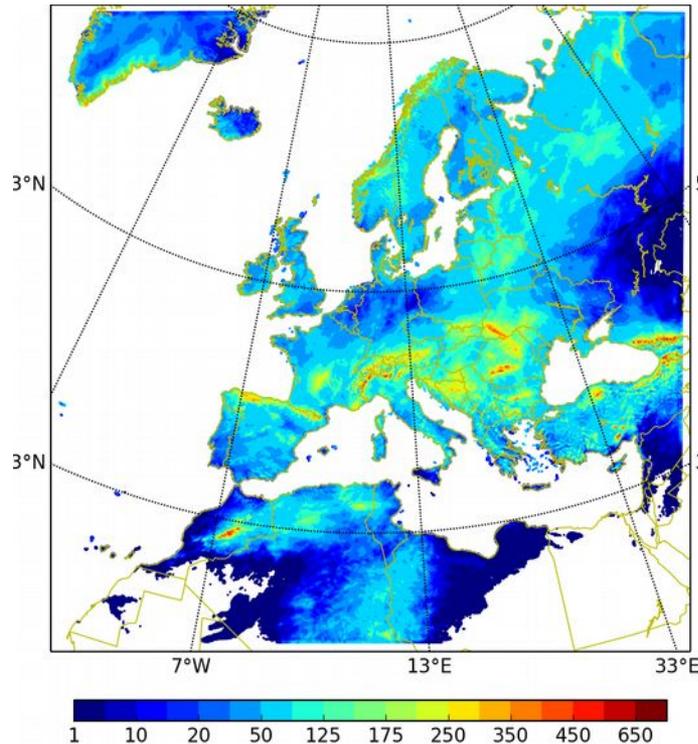

## Impact of model physics

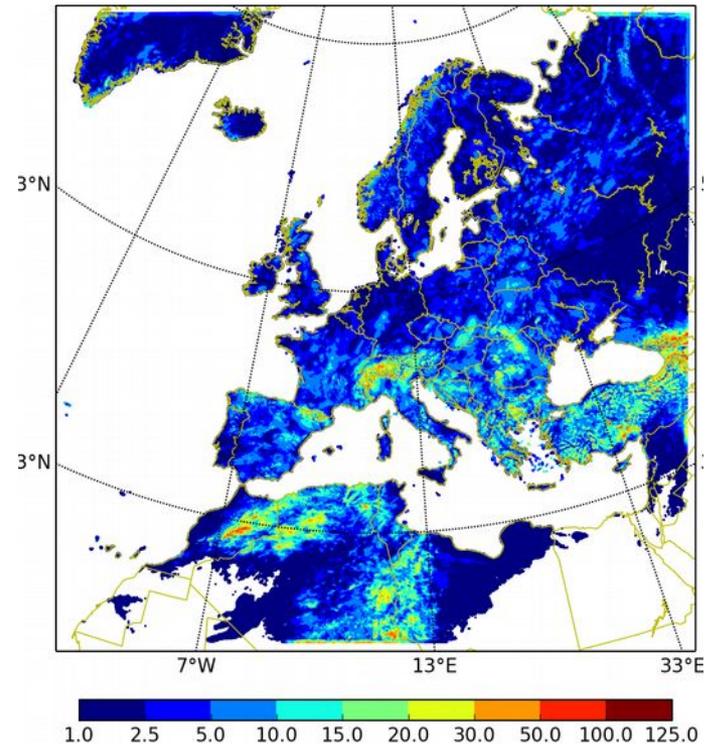

More variability in region without observations due to the physics in the model especially over North Africa and Turkey

# Ensemble ( 6-members) MEAN and SD for RR24-h Precip Analysis (June 2010)

## Ensemble Mean

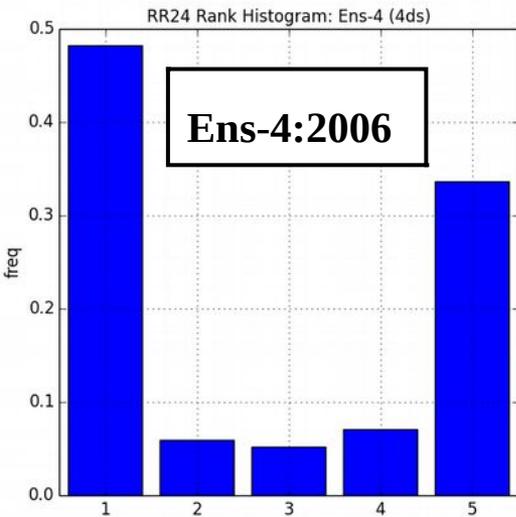

## Ensemble Mean SD

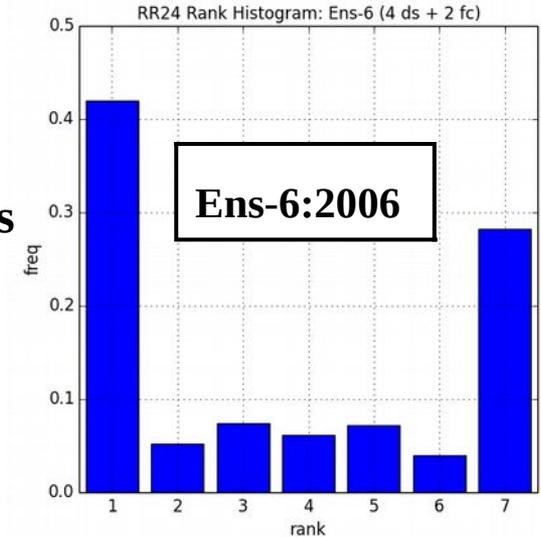

Higher uncertainties over mountains & regions lacking observation, preliminary due to the model physics : over Atlas coefficient of variation (CV) can reach 80%

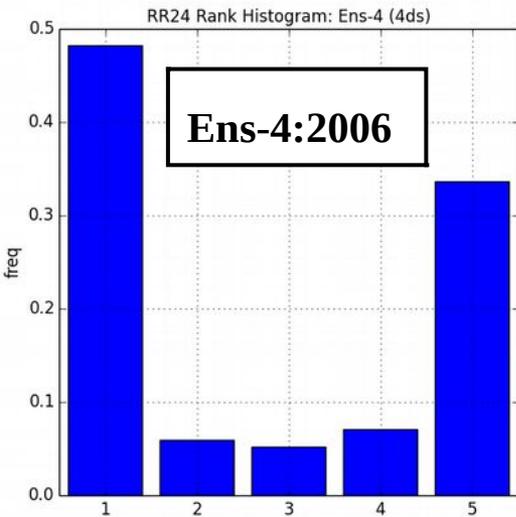

# Rank Histogram for RR24 January 2010 & 2006 over Europe

- **Ens-6 with ALADIN at 5.5km is slightly better than Ens-4, but still with under dispersion**

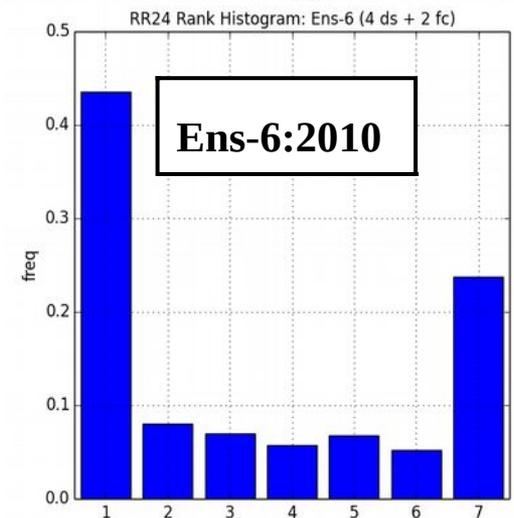

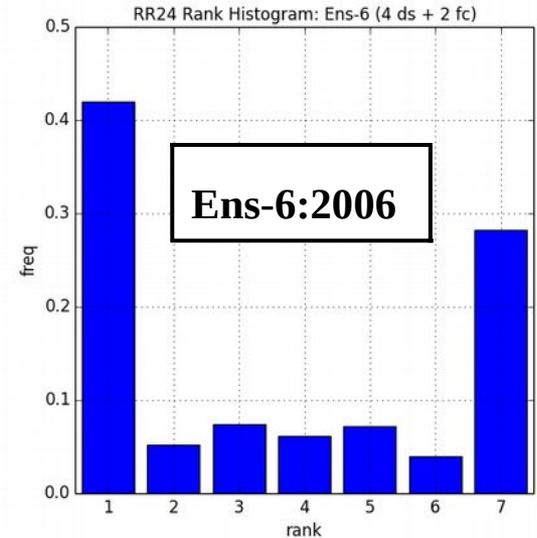

# Rank Histogram for RR24 January 2010 & 2006 over Europe

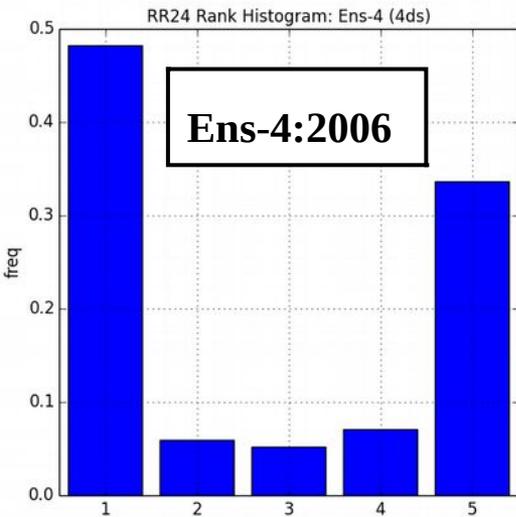

- **Ens-6 with ALADIN finer scale is slightly better than Ens-4, but still under dispersion**

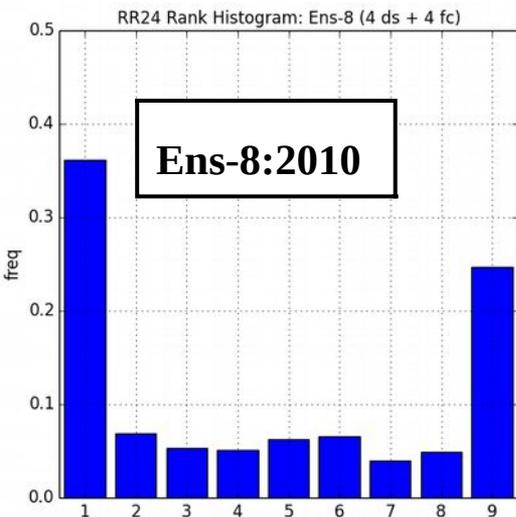

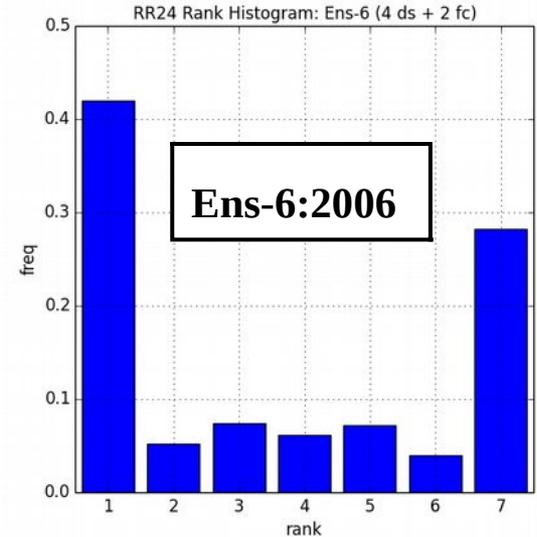

- **Ensemble spreads over January of 2010 & 2006 are similar**

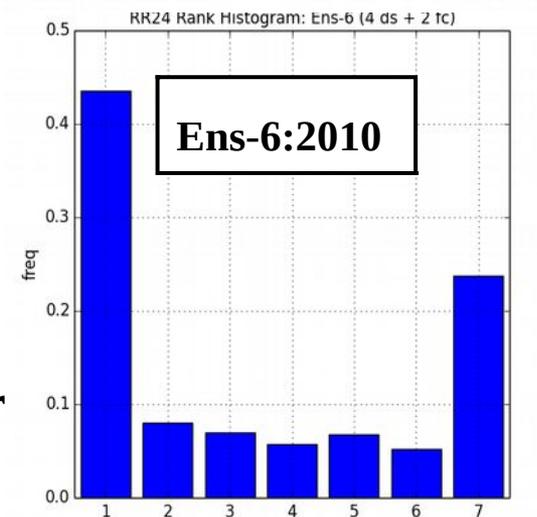

# Rank Histogram for RR24 January 2010 & 2006 over Europe

- **Ens-6 with ALADIN finer scale is slightly better than Ens-4, but still under dispersion**

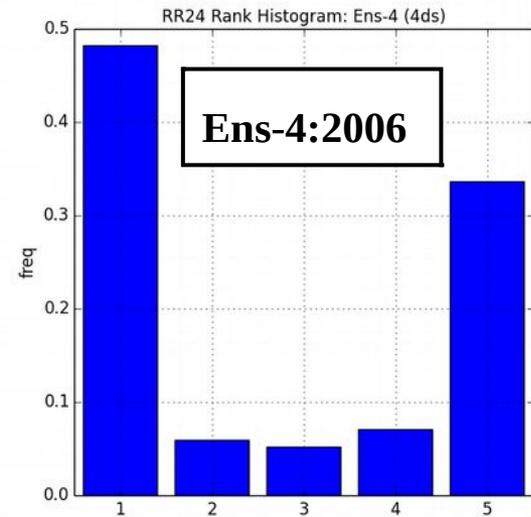

- **Ensemble spreads over January of 2010 & 2006 are similar**

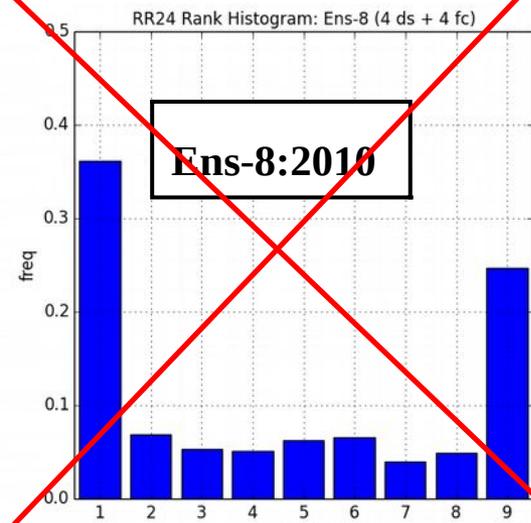

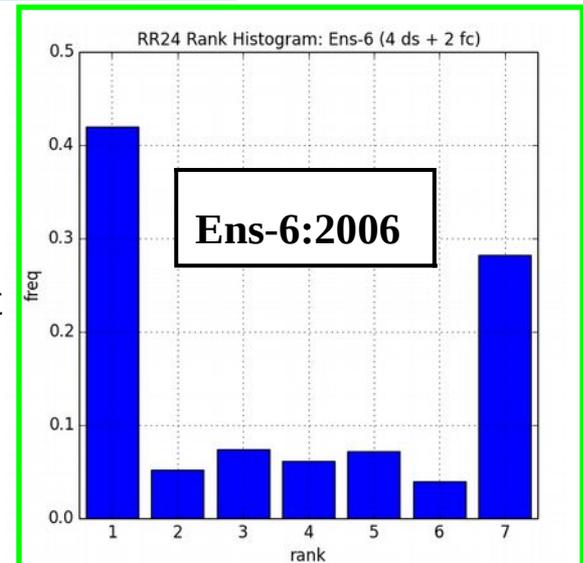

- **Ens-8 = Ens-6 + 2members with ALARO at 5.5km but very expensive (not enough computer time for the 5 years !)**

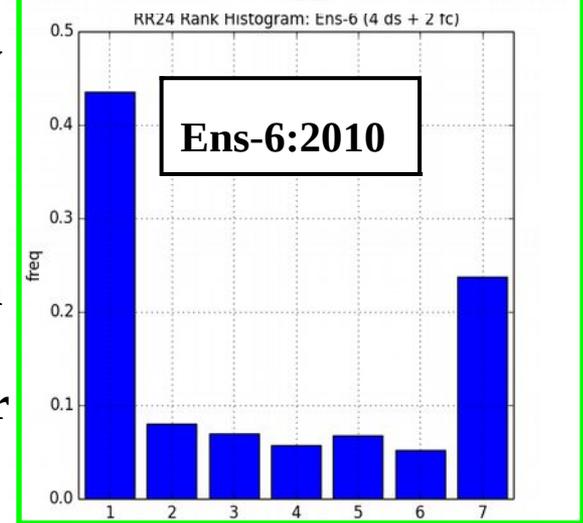

# Rank Histogram for RR24 January 2010 & 2006 over Europe

- **Ens-6 with ALADIN finer scale is slightly better than Ens-4, but still under dispersion**

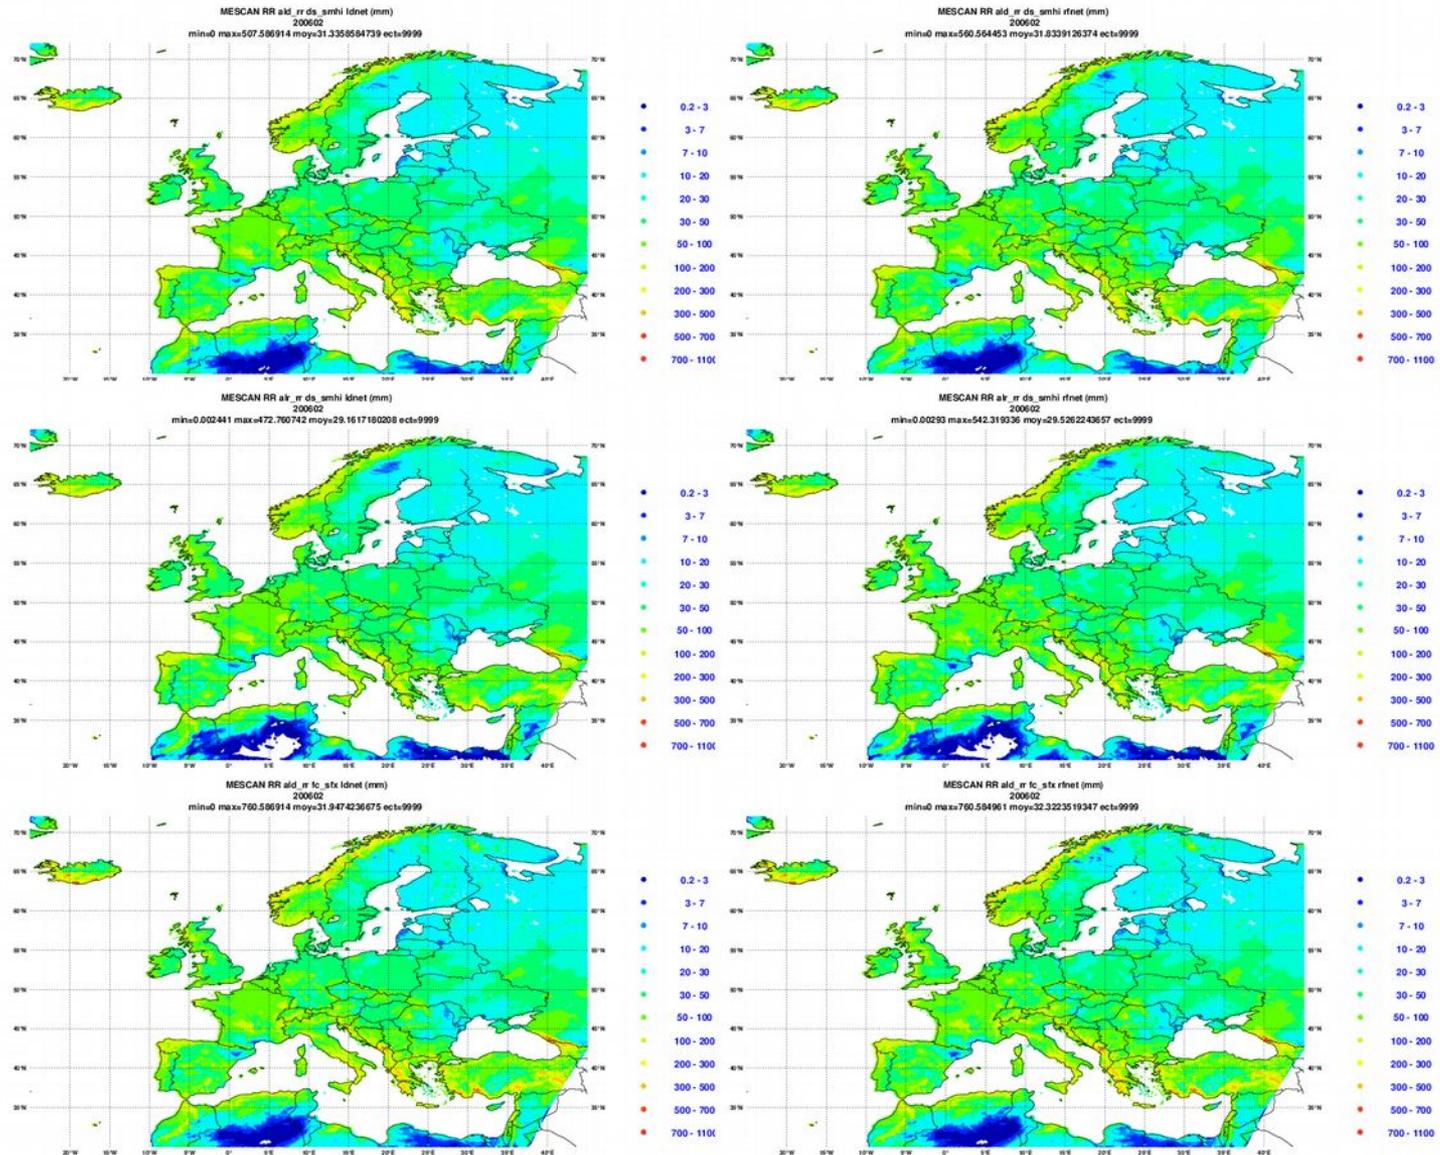

- **Ensemble spreads over January of 2010 & 2006 are similar**

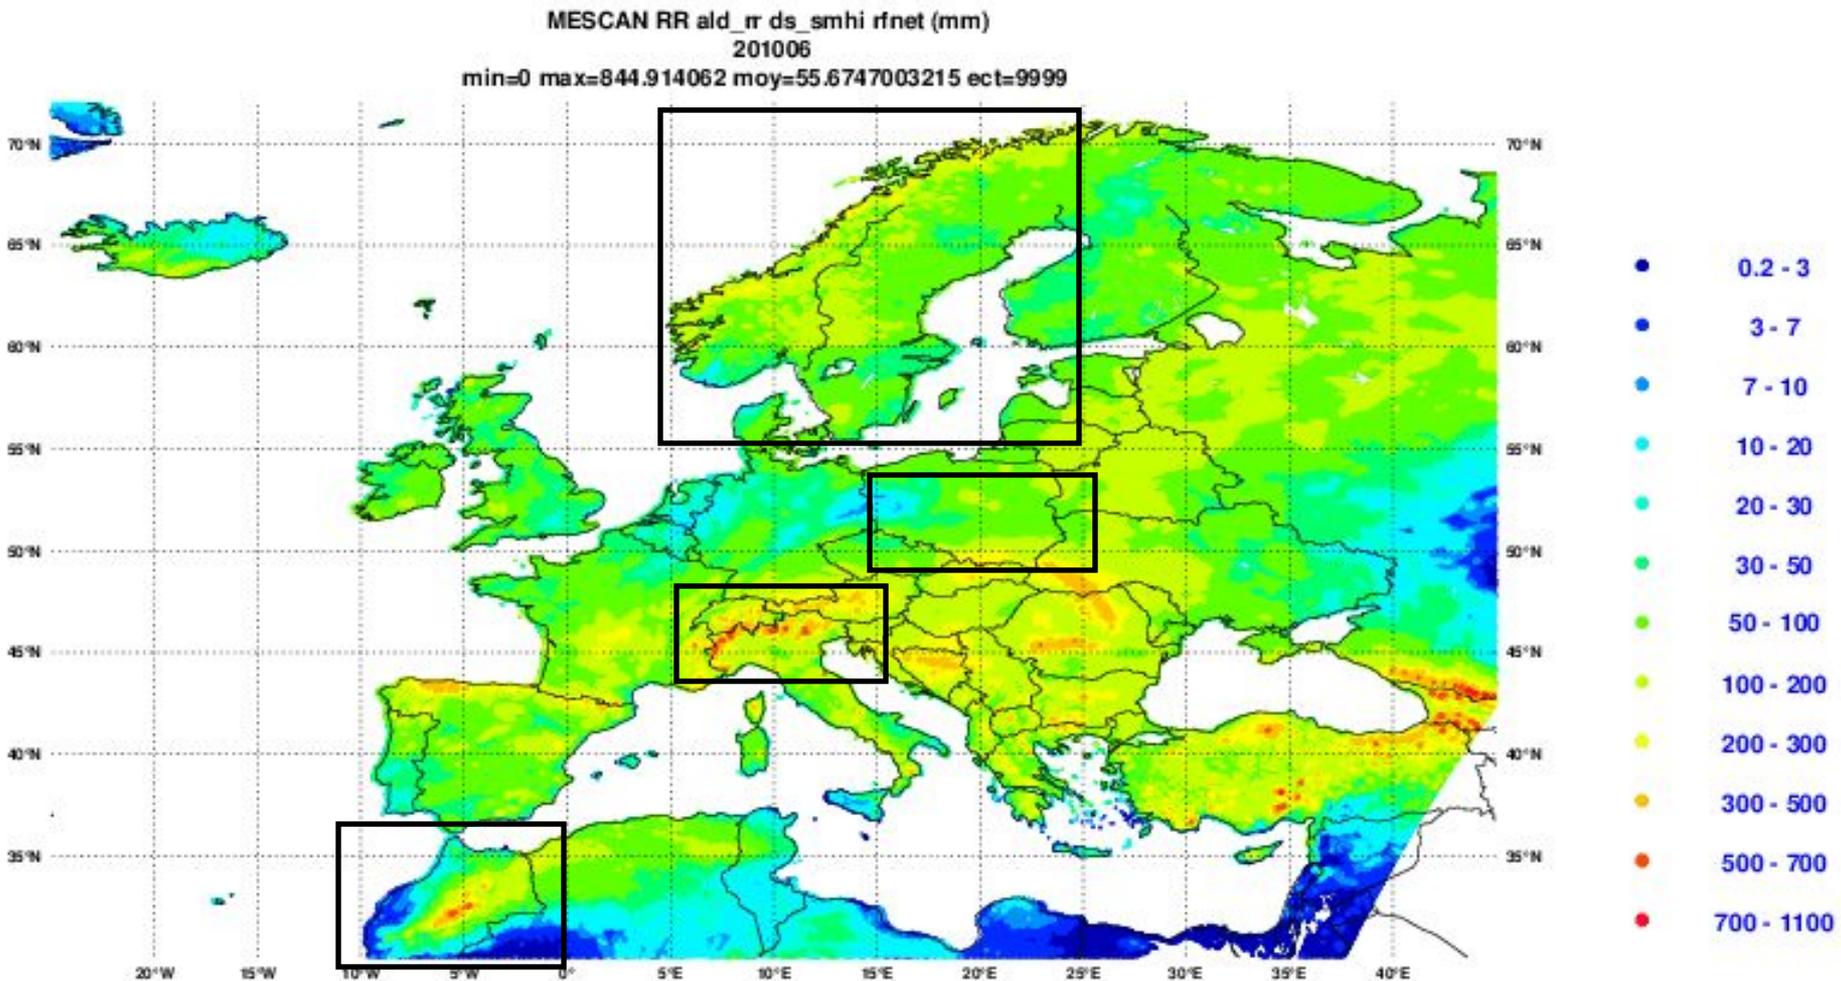

- **Ens-8 = Ens-6 + 2members with ALARO at 5.5km but very expensive (not enough computer time for the 5 years !)**

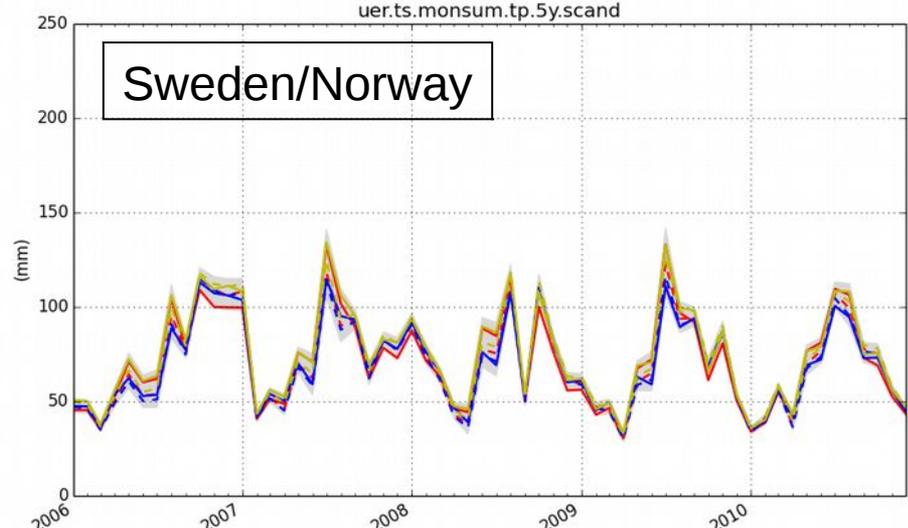

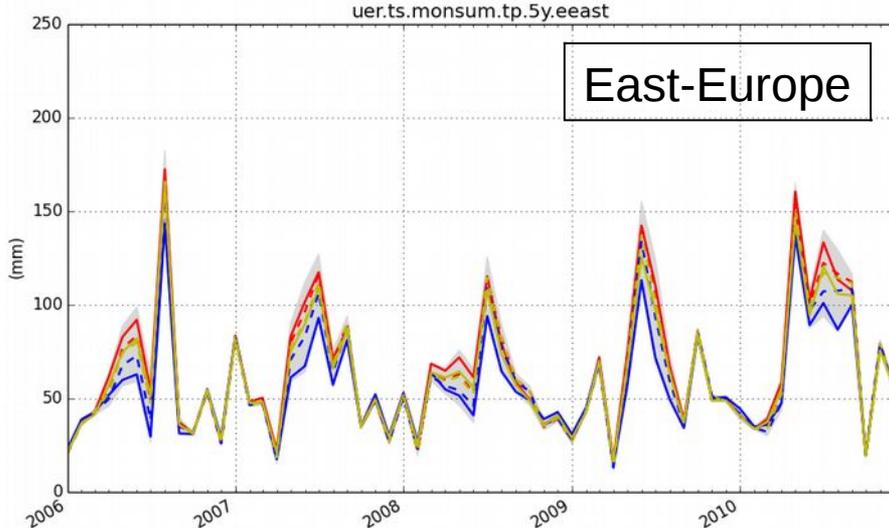

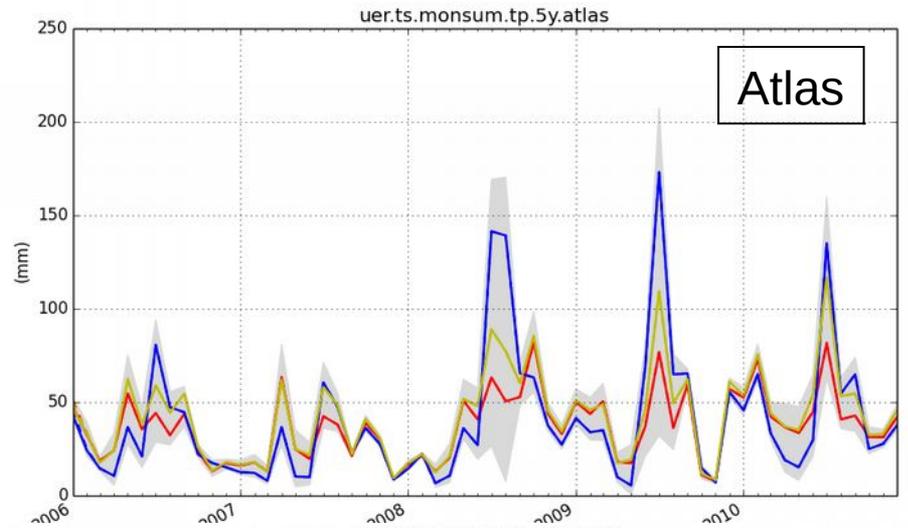

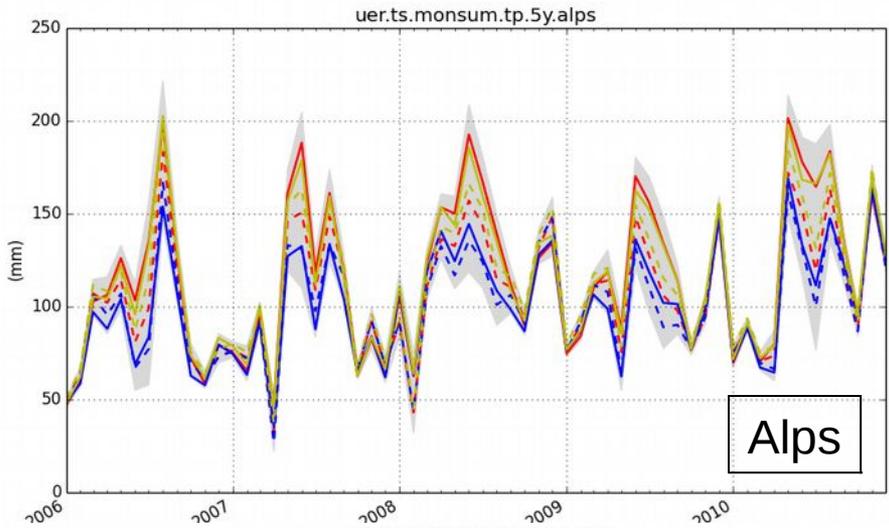

# RR24 : Ensemble members for 2006-2010 over Europe

# RR24 : Ensemble members for 2006-2010 over Europe

# RR24 : Ensemble members for 2006-2010 over Europe

UERRA GA4 21-23 November 2016, ECMWF, Reading, UK

# Setup for the Ensemble System at 5.5km for 2m-temperature & Rh

---

# Three background members @5.5km

- Two members from ALADIN & ALARO models (with SURFEX) at 11km downscaled to 5.5km.
- One member from ALADIN forecast (with SURFEX) at 5.5km
  - Background for T2M, Hu2m and Wind are improved with the model at 5.5km vs the downscaling of the 11km background (C. Soci et al, EMS2014)

# Two configurations of the observation network : low density and “all obs”

# Perturbed observation approach for 4 members (based on “all obs” network )

# Setup for the Ensemble System at 5.5km for 2m-temperature & Rh

---

# Three background members @5.5km

- Two members from ALADIN & ALARO models (with SURFEX) at 11km downscaled to 5.5km.
- One member from ALADIN forecast (with SURFEX) at 5.5km
  - Background for T2M, Hu2m and Wind are improved with the model at 5.5km vs the downscaling of the 11km background (C. Soci et al, EMS2014) **(not used yet due to a bug discovered one month ago for the initial soil moisture.**

# Two configurations of the observation network : low density and “all obs”

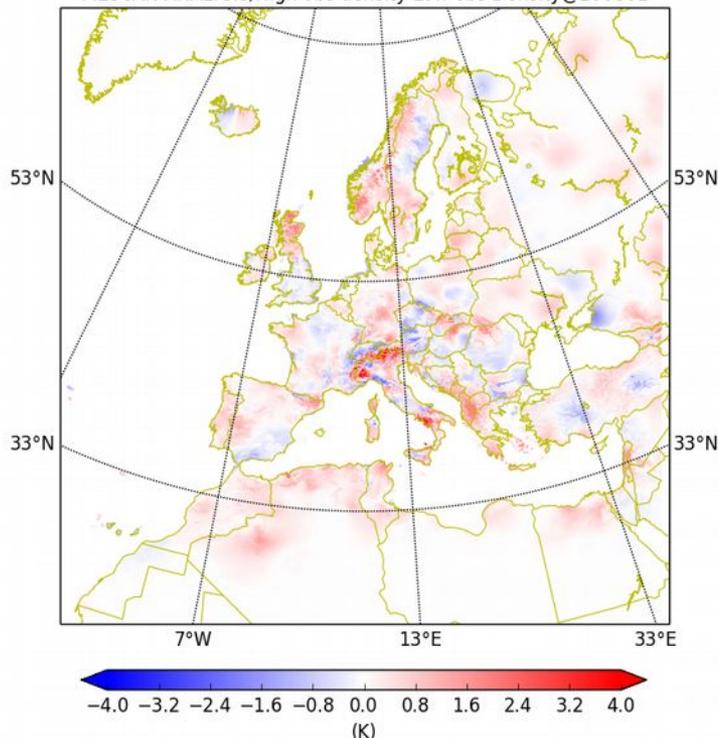

# Perturbed observation approach for 4 members (based on “all obs” network )

# Effect of observation density and model physics on the T2m surface reanalysis (Jan 2006 )

## Impact of network density

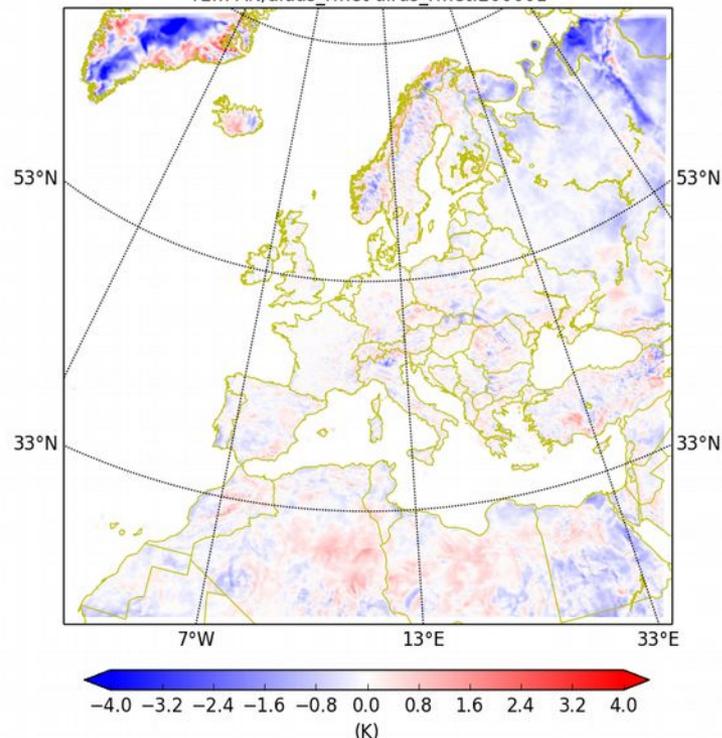

MESCAN-ANALYSIS/High obs density-Low obs Density@200601

More impact in mountainous area: fine scale, larger error with snow ...

## Impact of model physics

T2m-AN/aldds\_rfnet-alrds\_rfnet:200601

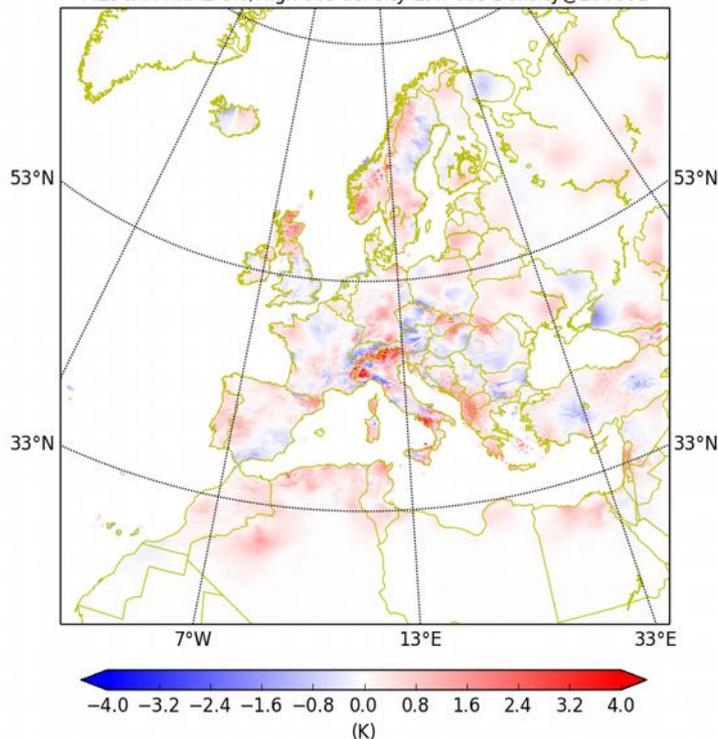

More impact where observations are sparse !

# Effect of observation density and model physics on the T2m surface reanalysis (Jan 2006 )

## Impact of network density

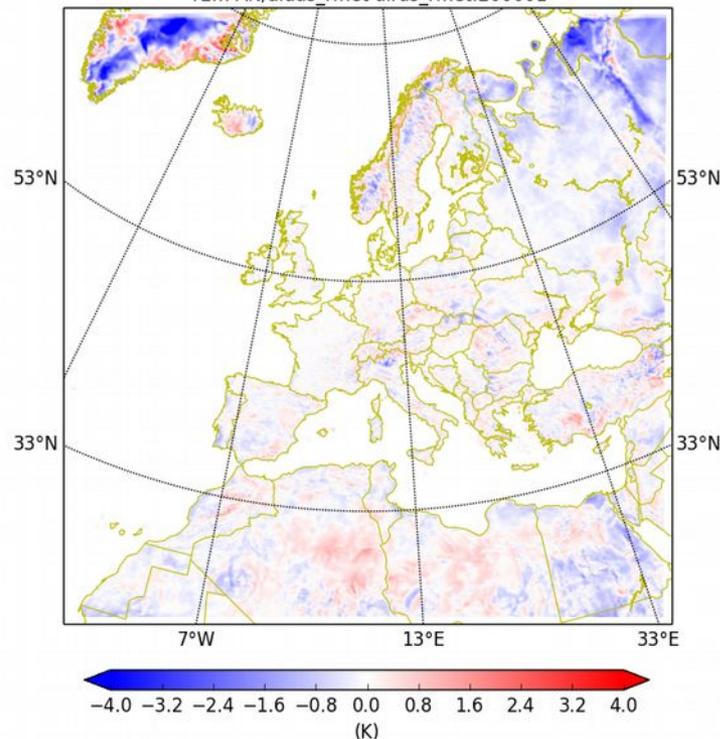

MESCAN-ANALYSIS/High obs density-Low obs Density@200601

More impact in mountainous area: fine scale, larger error with snow ...

## Impact of model physics

T2m-AN/aldds\_rfnet-alrds\_rfnet:200601

More impact where observations are sparse !

We need both approaches to estimate “correctly” the uncertainties in time and space

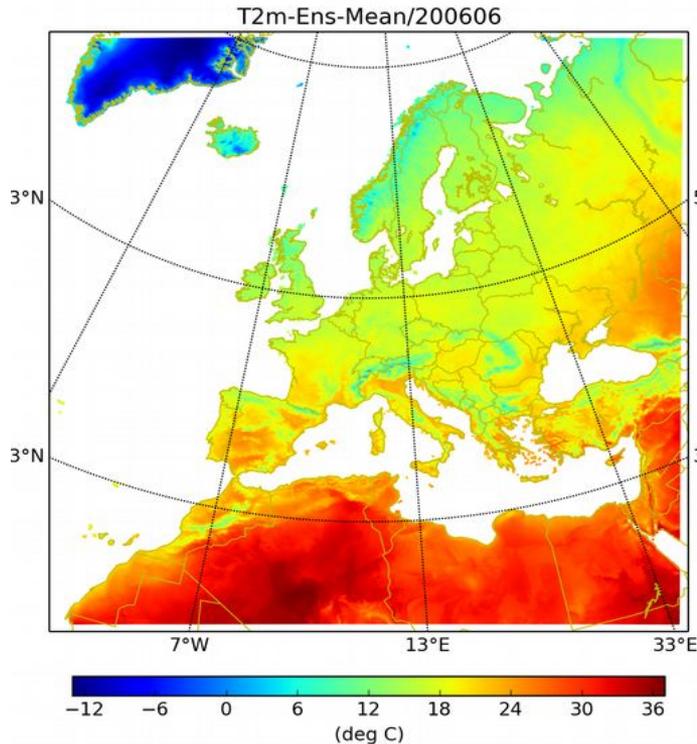

UERRA GA4 21-23 November 2016, ECMWF, Reading, UK

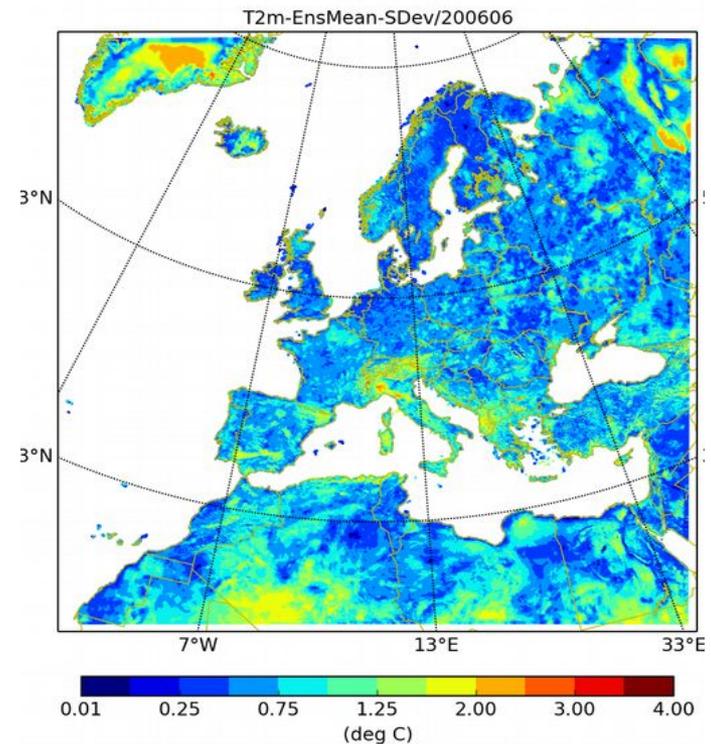

# Ensemble ( 6-members) MEAN and SD of T2m Analysis (June 2006)

## Ensemble Mean

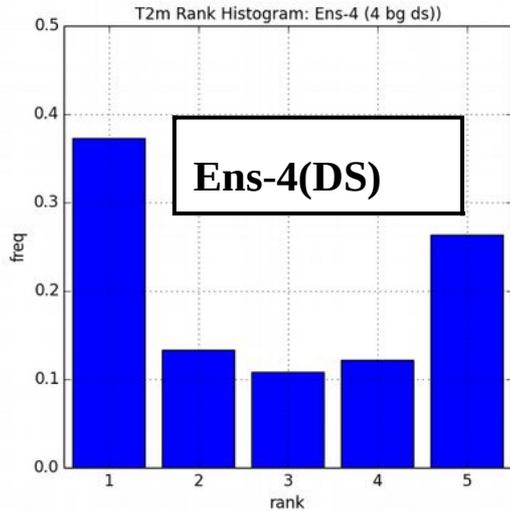

## Ensemble Mean SD

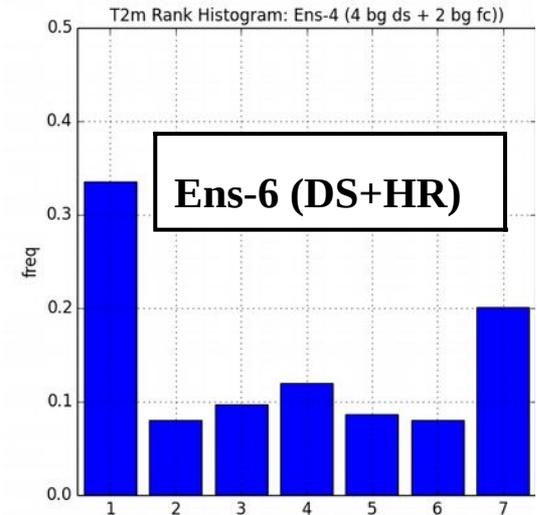

SD is smaller (below  $< 1^\circ$ ) where observations are dense and in flat area.

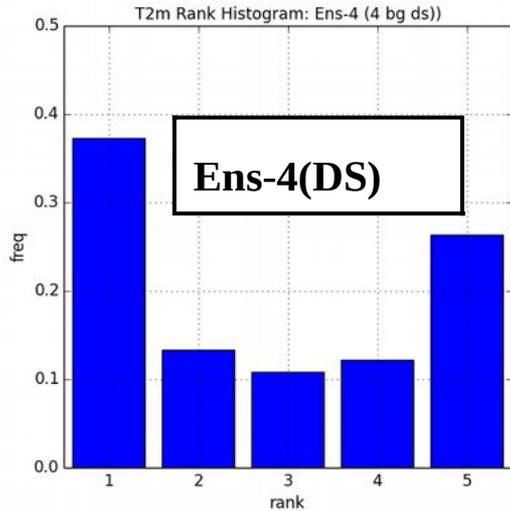

# Rank Histogram for T2m for June 2006 over Europe

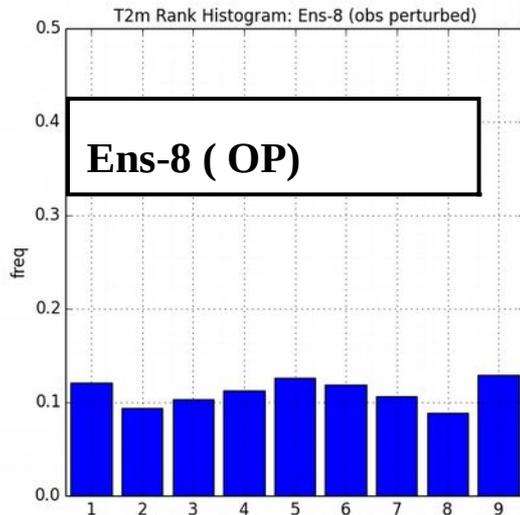

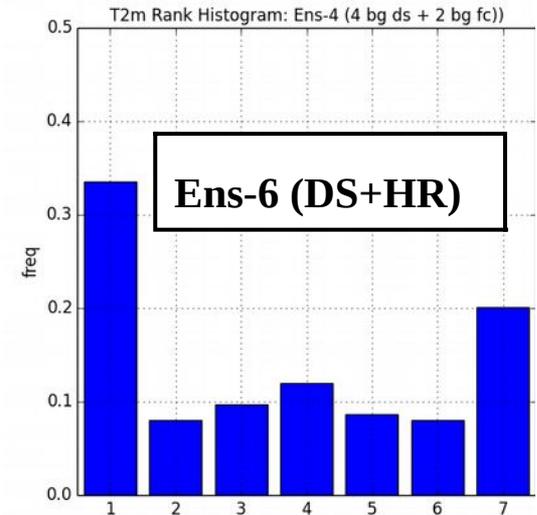

- **Ens-6 including finer scale from ALADIN is better than Ens-4**

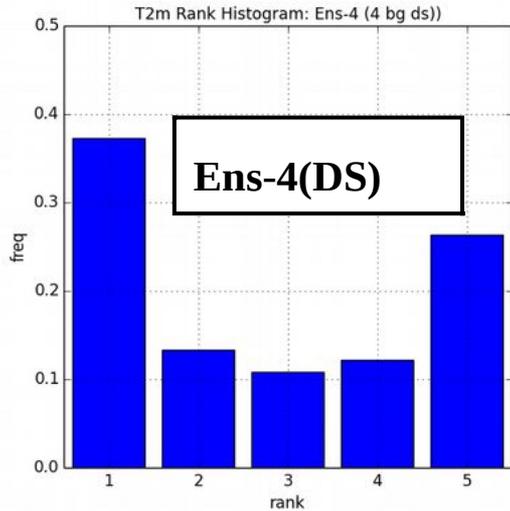

# Rank Histogram for T2m for June 2006 over Europe

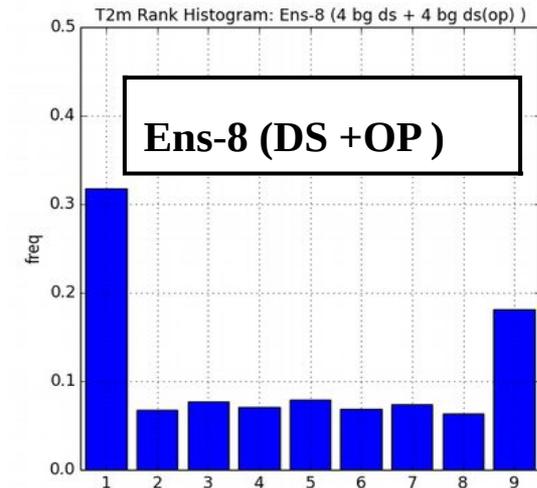

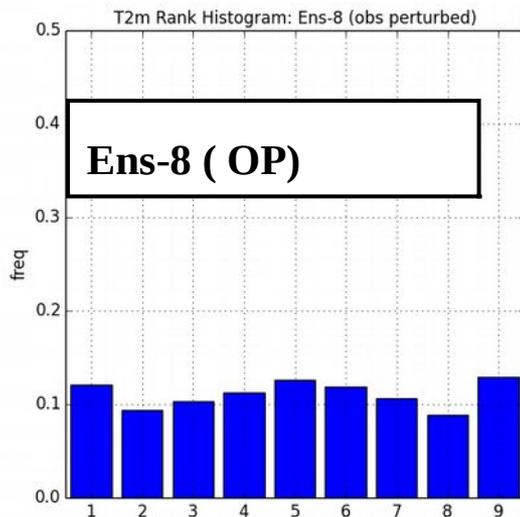

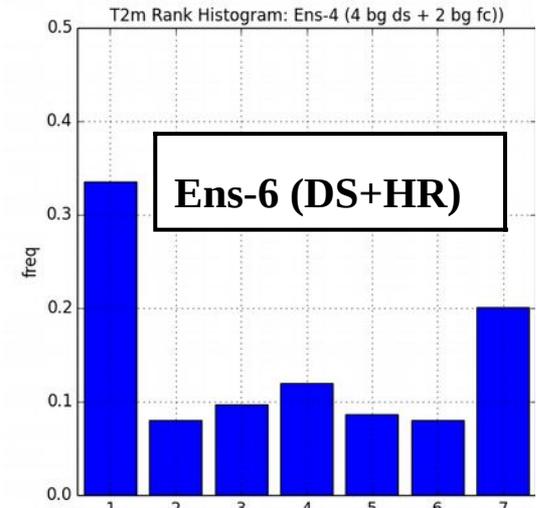

- **Ens-6 including finer scale from ALADIN is better than Ens-4**
- **Ens-8 with ALADIN bg (DS) and perturbed obs. Shows a better spread but does not take into account the uncertainties coming from a lower density and the 2 model physics**

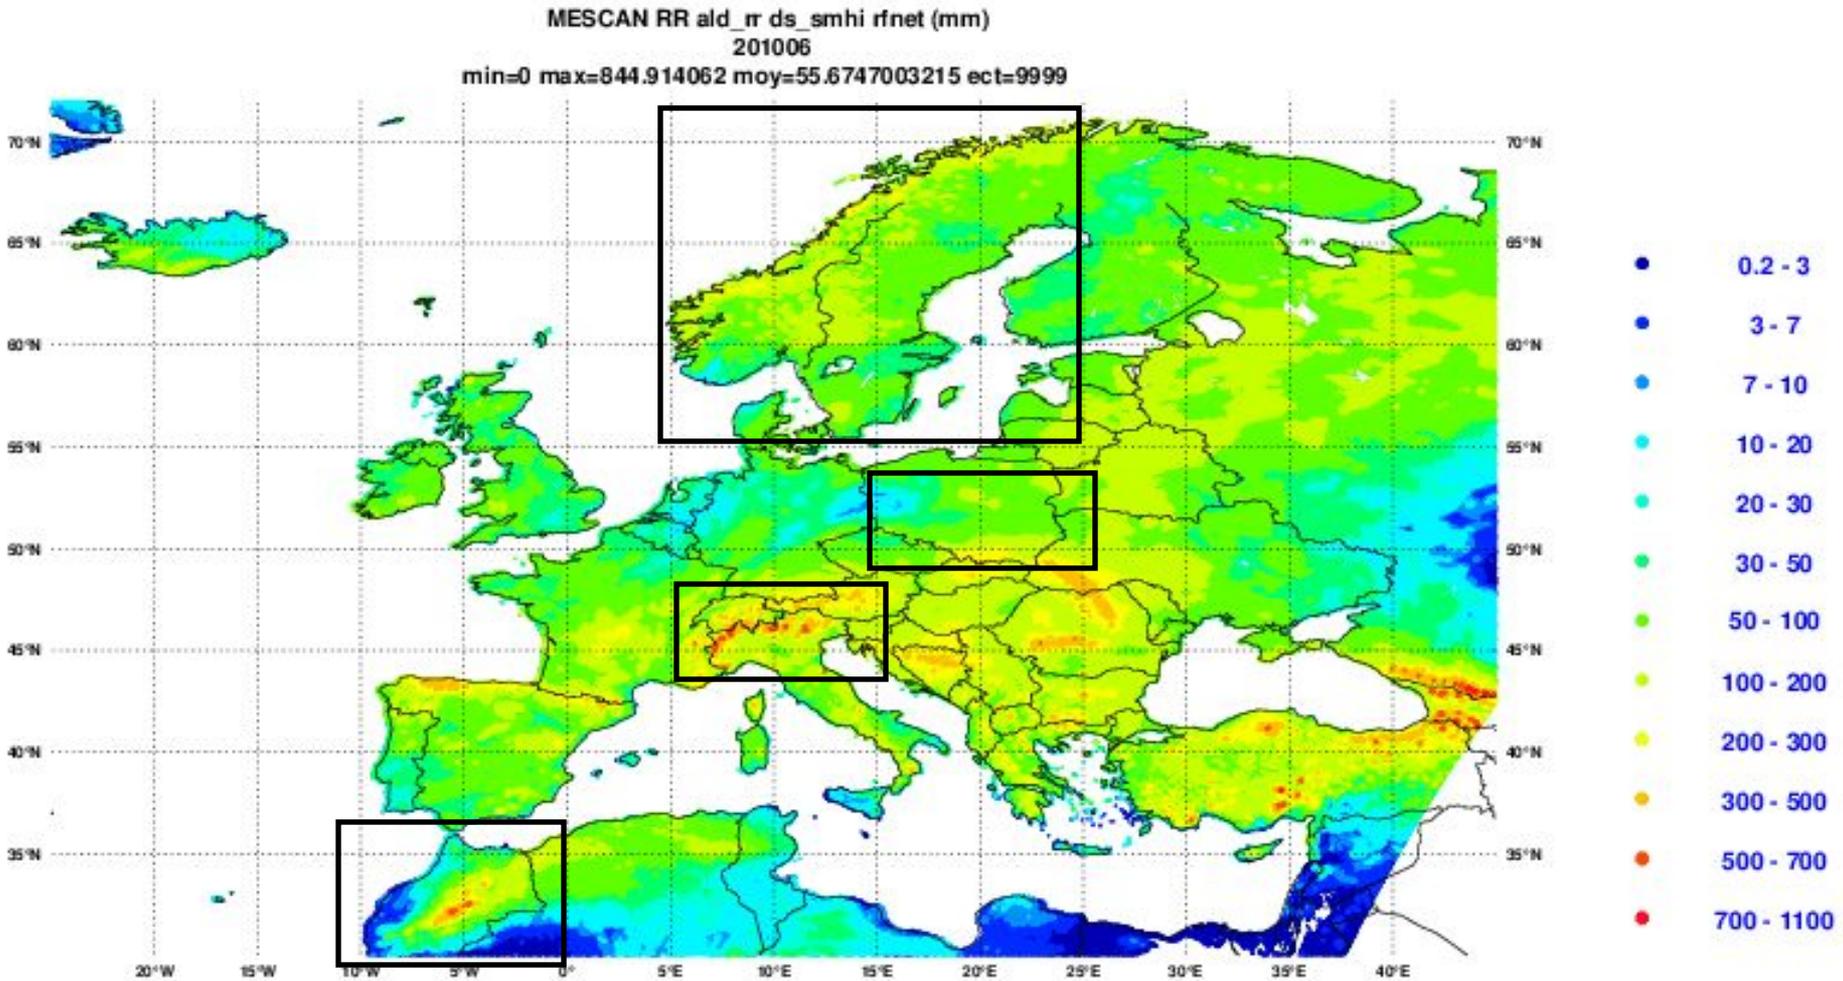

# Rank Histogram for T2m for June 2006 over Europe

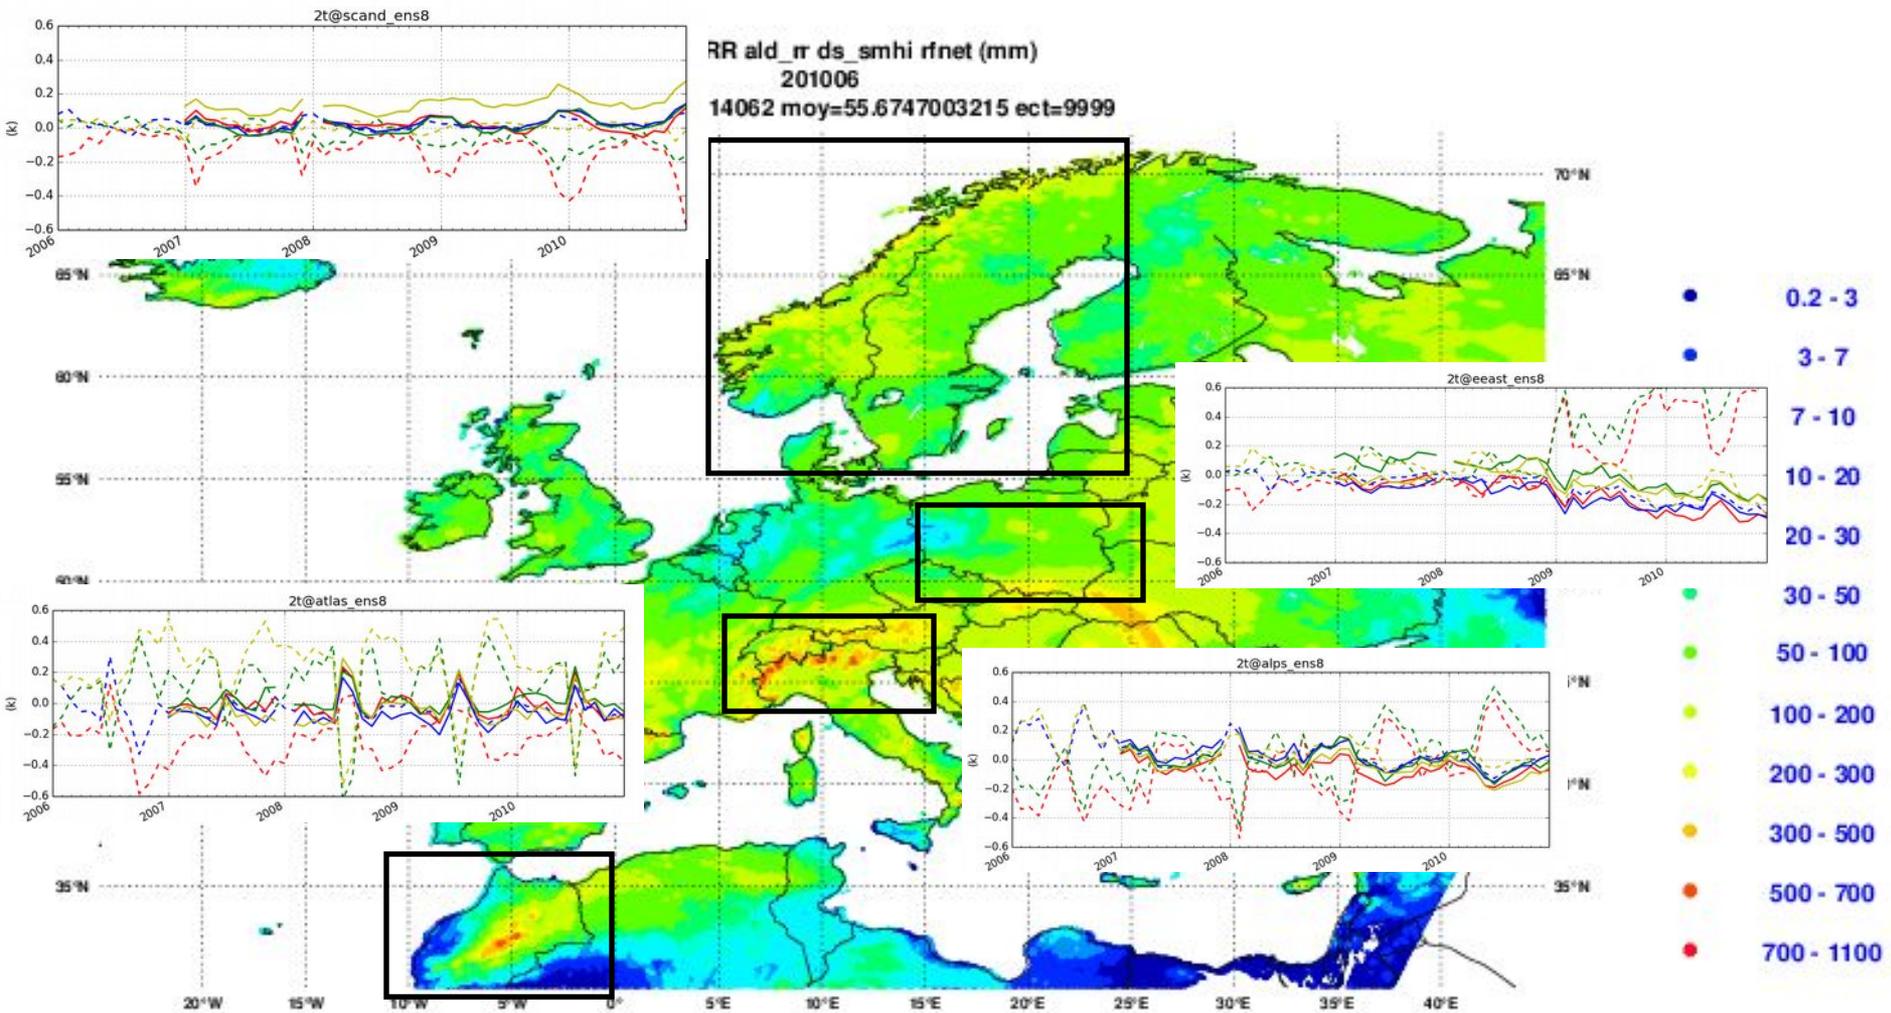

- **Ens-6 including finer scale from ALADIN is better than Ens-4**
- **Ens-8 with ALADIN bg (DS) and perturbed obs. Shows a better spread but does not take into account the uncertainties coming from a lower density and the 2 model physics**
- **Ens-4(DS) with 4 members picked randomly from Ens-8 (OP) is better than Ens -4 and Ens-6**

# T2m : Ensemble members for 2006-2010 over Europe

# T2m : Ensemble members for 2006-2010 over Europe

UERRA GA4 21-23 November 2016, ECMWF, Reading, UK

# Production status

---

- **For the period 2006-2010:**
  - Ensemble is complete for the T2m/Hu2m with 8 members and for the 24H precipitation analysis with 6 members.
  - Grib1 file are available BUT not yet in GRIB2 and not available on Mars.
- **For the show case:** 2008 is available on Mars with analysis data and SURFEX output (special thanks to F. Besson, A. Verrelle & R. Mladek) but probably still some works is needed for some soil variables ...
- **The reference production has started based on the new downscaled SMHI-3Dvar-ALADIN :**
  - First we need to downscale the SMHI-ALADIN background (T2m, Hu2M and precipitation) : one month in one day on (cca or ccb)
  - Period done: 1961-1964, 1970-1971, 1990-1993, 2000-2002, 2006-2012

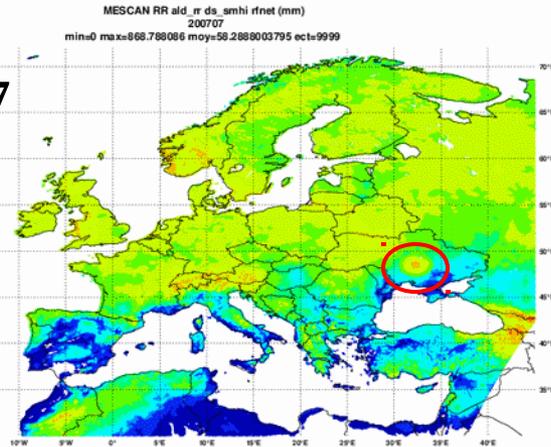

# Production status

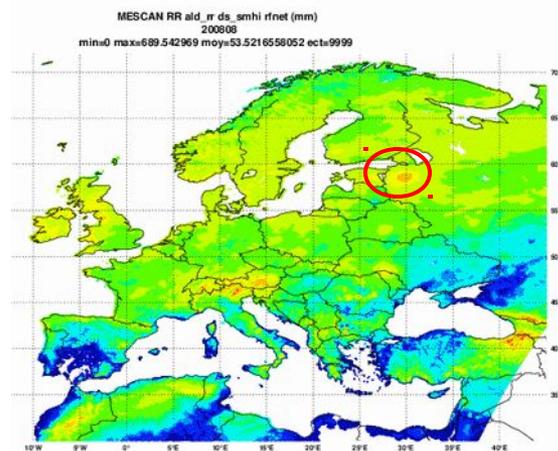

- The reference production has started based on the new downscaled SMHI-3Dvar-ALADIN :
- Precipitation analysis done for 2006-2010 : one year in 1.5 days BUT we will need probably to re-run some periods due to suspicious observations

...

July 2007

Aug. 2008

- Temperature/Relative humidity done for 2008.
- 2006 almost finished 15<sup>th</sup> November & 2007 29<sup>th</sup> July

## Conclusions :

---

- For the precipitation analysis, the differences in the physic model create uncertainties in area without observation (ex North Africa)
- Fine scale comes ONLY from the background at 5.5km especially for RR (Soci et al (2016))
- Large variability of the density network across Europe (partly due to the data policy) and along the 50 years
- Uncertainties come from the evolution of the observation network, observations errors AND model errors.

## Conclusions & for the coming months :

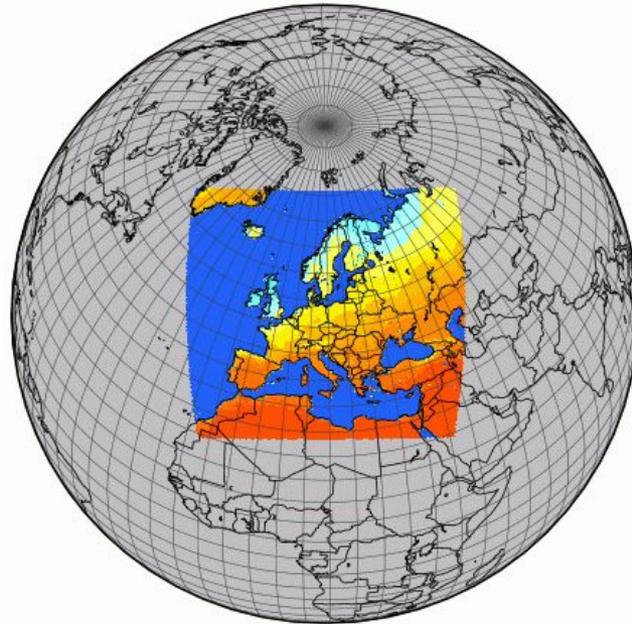

---

1. Report on the surface ensemble re-analysis (re-run the ALADIN & ALARO model at 5.5km with the correct soil moisture for 2008) → 31 dec 2016
2. Surfex soil variable in GRIB2 on Mars & put the ensemble MESCAN.
3. Create observations file for the period 1961/1980 especially for the precipitation from several data bases (ECMWF, MF, SMHI, ECA&D)
4. Continue to downscale the SMHI background : follow the SMHI production
5. Sensitivity experiments with SURFEX-TRIP using MESCAN-ENSEMBLE impact on river discharge, snow, soil moisture etc ...(P. Le Moigne Talks)

---

Thank you for your attention! Questions ?
